目录

犯罪类.....	11
双边类 恐惧犯罪的应对措施.....	11
报告类 许多人感觉不安全.....	12
观点类 通过教育降低犯罪率.....	13
双边类 减少犯罪的最好方法是延长服刑期还是其他.....	14
观点类 教育、培训罪犯 VS 送进监狱	16
观点类 教育罪犯以帮助他们出狱后找工作以防再次犯罪.....	18
观点类 犯罪是人们的天性使然.....	19
报告类 全球青少年犯罪增加的原因和惩罚措施.....	20
观点类 破坏学校的 14 岁少年应该被送往监狱	21
观点类 青少年犯罪应当同成年人受到同样的惩罚.....	22
观点类 政府是否应该监管电影电视节目以降低犯罪率.....	23
观点类 媒体中犯罪信息是否应该受到限制.....	24
观点类 法律对人的行为的约束.....	25
工作类.....	26
观点类 工作是人生最重要的事.....	26
报告类 难以达到工作和生活平衡.....	27
观点类 更换工作和住所是好的还是不好的发展.....	28
混合类 不断换工作的原因.....	29
报告类 人们不再依赖一份工作生活.....	31
双边类 随意选择工作,还是现实为上?	33
观点类 恪守职业比频繁换工作更容易感到满足.....	34
观点类 无法享受工作时不如不找工作.....	35
观点类 通过面试了解员工.....	36
观点类 年轻人做领导.....	37
报告类 青年离开老家去城市学习工作的原因利弊.....	38
观点类 新技术的普及使青年比老年人更有求职优势.....	39
报告类 年长者与年轻人同时竞争工作.....	41
观点类 老年人可以继续工作.....	43
利弊类 不能因年龄拒绝求职员工.....	45
观点类 工作是否应该男女分工.....	46
双边类 女性能否在警察军队中担任男性一样的角色.....	48
报告类 刚毕业新员工缺乏基本人际交往能力.....	49
混合类 限制工作时长的法律.....	52
观点类 企业至少 4 周年假可以更有利于员工的工作	54

观点类 企业应该有社会责任感.....	56
利弊类 企业从大城市迁移到地方是否利大于弊.....	57
利弊类 商务培训和会议在网上举办的利弊.....	58
利弊类 网络普遍使人可以在家工作学习.....	59
利弊类 电脑技术使人可以在家工作.....	60
观点类 在家办公对谁有利.....	61
国际类.....	62
双边类 对社区直接援助 vs 赞助慈善组织	62
双边类 是否应该有国际援助.....	63
双边类 援助是否不分地区?	64
观点类 世界上多数问题源自人口过剩.....	66
双边类 名人能提高国际援助的关注度?	67
观点类 紧急问题只能国际合作解决?	68
混合类 社会受益于国际旅游和国际商业带来的亲密关系.....	70
观点类 跨国公司对所有人有利.....	71
环境类.....	72
利弊类 人们在偏远地区和无人区找能源是否利大于弊.....	72
观点类 科学家和游客都可以去偏远的自然环境.....	73
混合类 消费品产量提升对环境伤害原因及解决方案.....	74
报告类 垃圾回收不够的原因和解决办法.....	75
观点类 种树还是盖房.....	77
双边类 淡水的使用权.....	78
报告类 人们不理解自然界重要性的原因和了解方法.....	79
观点类 个人无力改善环境，只有靠政府.....	81
双边类 简单生活还是靠科技解决环境问题.....	82
双边类 个人是否能改善环境.....	83
观点类 如何应对气候变化.....	85
双边类 人类对动植物的危害.....	86
观点类 保护开始灭绝的动物.....	88
观点类 我们是否要去拯救濒危动物.....	89
讨论类 给予野生动物和鸟类太多关注和资源.....	90
观点类 花费时间金钱在保护野生动物还是人类本身.....	92
双边类 动物园是否应该关闭.....	93
观点类 把动物作为食物或制造商品.....	95
观点类 用动物做实验是否有必要.....	97
健康类.....	99
报告类 为什么人们坚持不健康的生活方式.....	99

报告类	现代生活使人不健康.....	100
观点类	靠吃肉来保持健康饮食.....	101
观点类	减少环境污染和住房问题以避免疾病.....	102
双边类	公民饮食健康该由谁负责.....	104
观点类	商店不得出售对健康有害的食物和饮料.....	105
利弊类	设施训练顶级运动员，还是人人可用.....	106
双边类	危险运动是否被禁止.....	107
双边类	比赛胜负取决于身体还是心理.....	109
双边类	制药公司为穷国家研发药品 VS 挣钱为目的	110
利弊类	研发新药和新疗法该由谁来资助.....	111
观点类	政府花更多的钱预防疾病更好吗？	112
双边类	政府应该优先关注医疗？	114
报告类	孩子打电脑游戏而不运动.....	116
混合类	退休的人孤单且不健康的原因及解决方法.....	118
教育类		119
观点类	为照顾好孩子父母应参加育儿课程.....	119
双边类	父母应给孩子读书讲故事吗.....	120
观点类	老师对孩子智力和社交能力的影响比父母大.....	121
混合类	父母满足孩子一切要求的好坏和未来影响.....	122
利弊类	家长在家教育孩子.....	123
双边类	孩子至少七岁以上才能上学.....	124
利弊类	孩子从小刻苦对其的积极或消极影响.....	126
报告类	如何给孩子减压减负.....	128
利弊类	学生花大量时间学习.....	130
利弊类	孩子拥有更多自由的利弊.....	131
报告类	小孩喜欢看电视的原因和解决方法.....	132
观点类	孩子沉迷电视和电玩不利于心理健康.....	133
观点类	孩子应该被鼓励看电视.....	134
利弊类	让孩子玩电脑或 iPad 来学习科技.....	136
双边类	孩子玩电脑游戏的利弊.....	138
观点类	阅读比看电视更能锻炼想象力和语言能力.....	140
双边类	选择喜欢的科目，还是政府决定科目.....	142
观点类	政府应投更多钱在科学.....	143
双边类	学习各类科目还是深入学习较少科目.....	144
双边类	学生是否必须学外语.....	145
观点类	学生应该花时间去外国学习语言和文化.....	147
观点类	艺术课程应成为高中必修课吗.....	149

双边类	中学生学习国际新闻是浪费时间？	150
双边类	学历史还是其他课程对孩子成长更有帮助	151
双边类	中学全面教学 VS 个别领域教学	152
双边类	根据学生能力进行挑选并教学	153
双边类	集中教学还是分层教学	154
双边类	学校所教内容是否有用	155
观点类	国际交换项目对所有青少年都好	156
观点类	大学生参与其他活动	157
观点类	大学生应专注一个科目还是广泛接触好？	158
观点类	年轻人是上大学还是去技校学习	159
双边类	去大学学习还是积累工作经验	161
教育类	更多人想去读大学	163
双边类	更多大学生对国家有利	165
观点类	大学该不该为偏远地区学生降低标准	166
利弊类	大学远程培训利弊分析	167
观点类	传统面授课是否仍被需要	168
利弊类	从网络获取信息知识的利弊	169
双边类	远程学习和面授的对比	170
观点类	学生过于依赖老师讲课学习	171
观点类	学生从老师处获取的知识比从其他渠道更多	172
观点类	老师的作用	173
观点类	大学生应该自己支付所有的学习费用	174
观点类	政府应该为所有人支付大学教育费用	176
利弊类	政府付一部分或全部的学生的学费	177
观点类	政府只资助好学生奖学金	179
双边类	哪类学生可以被奖励	181
双边类	多数青年上大学有利吗？	182
双边类	教育的目的是对社会有用还是满足自身	183
观点类	培养团队合作	185
观点类	团队活动更好	187
双边类	独自学习和一起学习哪个更好	188
科技类		189
观点类	手机和电脑使人们失去面对面交流的能力	189
观点类	现代通讯对社会关系造成负面影响	190
观点类	现代沟通科技优缺点	191
利弊类	通过网络减少面对面沟通	193
观点类	科技让我们的生活复杂还是简单	195

利弊类	新科技改变孩子娱乐方式的利弊.....	197
观点类	核能是不是最好的能源?	199
双边类	科技对食物种类和质量的影响.....	200
观点类	科学实验浪费时间和金钱?	201
双边类	科学家的作用.....	202
利弊类	许多工作依赖机器完成.....	203
利弊类	机械化的好坏处.....	205
双边类	电脑愈加智能对人类是好是坏?	206
利弊类	线上购物取代实体店.....	207
观点类	政府的太空开发投资是否合理.....	209
双边类	联系外星人的好坏处.....	210
双边类	科技对贫富差距的影响.....	211
旅游类		213
利弊类	太空旅游的影响.....	213
利弊类	去偏远地区旅游.....	214
利弊类	去边远地区旅游对当地影响.....	215
双边类	旅游让文化传统保存还是被破坏.....	217
观点类	负责任的游客.....	218
观点类	国际旅游导致冲突.....	219
报告类	国际旅游带来偏见.....	220
双边类	出国旅游是否有必要.....	221
媒体类		222
混合类	记者可信度.....	222
报告可	新闻媒体的重要性.....	223
观点类	新闻媒体的影响力.....	224
观点类	新闻媒体对人们生活的影响.....	225
观点类	媒体新闻报道消极问题还是积极发展?	226
观点类	媒体应该多报道好新闻.....	228
观点类	不再需要印刷报纸.....	229
双边类	报纸是最好的新闻渠道.....	230
观点类	报纸依旧是重要的新闻来源.....	231
报告类	报纸对人们的观点有很大影响.....	232
双边类	电视频道是否增加电视节目的选择和质量?	233
双边类	广告的好处和坏处.....	234
利弊类	广告影响人们的生活.....	235
观点类	广告影响了重要性认识, 并有消极影响.....	236
观点类	广告鼓励人们大量买东西.....	238

双边类 广告商以孩子为目标.....	239
观点类 针对儿童的广告是否该被禁止.....	241
观点类 食品广告应该被禁止吗?	242
观点类 社交媒体的利弊.....	243
社会类.....	244
利弊类 独居或小家庭取代大家庭.....	244
观点类 越来越多的人选择独立居住的原因?	246
观点类 快速改变的生活方式影响家庭关系.....	247
报告类 家人聚餐变少.....	248
利弊类 家人一起出国的利弊.....	249
报告类 人们搬家的原因和利弊分析.....	250
利弊类 越来越多人不认识邻居.....	251
混合类 母亲的角色与父亲角色不同.....	252
利弊类 父母角色互换的利弊.....	253
报告类 家庭主夫的原因和利弊.....	255
观点类 住在大城市对人们的健康不好.....	256
报告类 城市发展中年轻人的焦虑.....	258
双边类 生活在大城市累还是轻松?	260
报告类 城市化致使年轻人会面临的问题.....	261
混合类 大城市生活质量越变越糟的原因.....	262
报告类 政府鼓励人们搬去郊区.....	263
观点类 社区关系变得冷漠的原因及解决方法.....	264
报告类 年轻人不快乐.....	265
观点类 创造一个更幸福的社会.....	266
观点类 老一辈传统观念对年轻人的影响.....	267
双边类 政府养老还是自己养老.....	268
观点类 年轻人照顾老年人是否要立法.....	269
双边类 变老的影响.....	270
报告类 生育时间变晚.....	271
混合类 15 岁以下人口越来越多	272
利弊类 预计很多国家未来成为老龄社会的好坏.....	273
报告类 浪费商店或饭店买来食物的原因和解决方法.....	275
利弊类 人们喜欢吃外来食物, 是否优大于劣.....	276
利弊类 人们应当从当地菜农获取食物?	278
观点类 自给自足生产所有粮食.....	279
观点类 化肥和机器的进步造成负面影响.....	280
双边类 经济发展解决贫困和饥饿还是导致环境问题.....	281

利弊类	家用电器变多的利弊.....	282
观点类	年轻人将大部分时间花在购物上.....	283
观点类	商品相对便宜优缺点分析.....	284
观点类	年轻人在业余时间逛商场有负面影响.....	285
混合类	购物成为一种娱乐.....	286
观点类	购物习惯受什么影响.....	288
报告类	越来越多的人喜欢买名牌.....	289
混合类	容易受到时尚影响.....	291
观点类	人们倾向于模仿别人.....	293

犯罪类

双边类 恐惧犯罪的应对措施

Many people are afraid to leave home because of crimes. Some believe that more action should be taken to prevent crimes, but others feel little can be done. Discuss both views and give your opinion.

范文:

Many people today commit crimes for different reasons, for example, for earning easy money or for showing their anger. I believe that we can take some measures to curb crime, although tackling the root cause of crime is not easy.

There are many approaches we can adopt to deter crime. For example, the authorities can increase the visibility of police on the street, and if necessary, equip police officers with weapons, which can act as an effective deterrent. Another method is to use security cameras in public places, since these devices can capture the images of criminals to help catch criminals and take them to court. These methods are particularly important in crime hot-spots, where crimes happen frequently.

However, Some people are not confident in the effectiveness of these measures to combat crime because they believe that the economic slowdown and poverty are the primary causes of crime. Many companies have to downsize the workforce to cut the operating cost, and because of the high unemployment rate, some jobless people have chosen to commit crimes such as shoplifting, robberies, frauds and drug trading to get by. This problem is widespread among those poorly educated people, who cannot find employment and are not aware of their legal responsibilities.

In my view, education is another solution to crime, although it may take time to see the impact of giving young people more educational opportunities. If they attend school, they would realise that violence, drug trade and theft are all illegal. Similarly, schools or communities can provide vocational training to help them to acquire skills such as bookkeeping and culinary skills which can open the door to job possibilities. They would not make money outside laws, as long as they can find employment and have a steady source of income.

报告类 许多人感觉不安全

Many people nowadays do not feel safe either when they are at home or when they go out. What reasons for this change and what to do to solve this problem?

范文:

In spite of the fact that the social and economic development in the peaceful era has gradually enhanced people's quality of life, people in today's era, whether at home or outside, cannot maintain the sense of security, but rather feel fear. It seems to me that the insecurity of network and the wide spread of adverse information on media are the two main culprits for this phenomenon.

The first reason of the aggravating sense of insecurity is largely related to the leakage of personal information on the Internet. Although the popularity of online services, such as online shopping and takeout, has brought about enormous conveniences to people's life, personal information is also very easy to be accessed by others, by which I mean a culprit can easily obtain other people's telephone number, home address and other information even without hacker technology, which exerts numerous potential risks to people's security. The second the reason why people cannot feel safe is that they are easily influenced by the media. In the modern society, the popularity of mass media enables people to quickly understand the information of various places, both at home and abroad, and many multimedia works, with high viewing rating, are also shot with real criminal cases as the material. However, under the influence of such news and media works, they will certainly feel anxiety and fear when people encounter the same scene in their daily life.

Several actions can be taken in order to alleviate the aggravation of situation. First of all, it is the responsibility of the government to strengthen the supervision on the Internet. Enacting more rigid laws and regulations to deter people from stealing personal information is a must in the contemporary society. Besides, another effective solution is to properly control the content on the media. For those movies that contain a lot of criminal details and violent plots, it is suggested to limit the age of viewers, or to prohibit the media content that causes too much social panic.

In conclusion, I personally believe that issuing more laws and regulations to surveillance the Internet as well as controlling the content on media are the two solutions I came up with.

观点类 通过教育降低犯罪率

In many countries, prison is the common solution to the problem of crime. However, another effective way is to provide people with better education so that they will not become criminals. To what extent do you agree or disagree?

不同意

范文：

1. 受过教育的人也会使用高智商犯罪。

2. 虽然受到了良好的教育但是不知道犯罪的后果，无法重视。

In criminology, examining why people commit crime is very important in the ongoing debate of how crime should be handled and prevented. It is admitted that better education could effectively help to lower the crime rate. However, I believe in terms of seeking solutions in ultimately reducing types and levels of crime, broader perspectives need to be explored.

It is true that part of these crime acts is committed by people who fail to receive proper education. Normally, criminals are those who have problems in school including low grades, lack of attendance or disciplinary actions, such as suspension or expulsion. In these cases, it is hardly for them to be taught respect for authority and consideration for other or equipped with knowledge and techniques for a reasonable job. As a result, they may easily come up with subconscious thought that compel them to impulsive reactions when angry or steal out of a sense of need when feeling hopeless about making a living.

Such as it is, however, criminality cannot be fully avoided. According to research conducted regarding this, more factors namely, genes, environment, and society are involved in the criminality of individuals. Poor diet, mental illness, bad brain chemistry and even evolutionary rewards for aggressive criminal conduct have been proposed as explanations for crime. Also, people develop motivation to commit crime and the skill to commit crime through the people they associate with and the environment they are surrounded. For instance, a neighborhood that has fraying social structures featuring in vacant and vandalized buildings and high unemployment in particular, is more likely to have high crime rates.

In conclusion, as there exist different backgrounds that mold people into criminal behavior, offering better education can only take effect within a limited scale, and would not have the desired result.

双边类 减少犯罪的最好方法是延长服刑期还是其他

Some people think the best way to reduce crime is to give longer prison sentences. Others, however, think there are better alternative ways to reduce crime. Discuss both views and give your own opinion.

范文:

I would deeply analyse the myopic suggestion of some arguing for the enlarging prison sentences to preclude the occurrence of crimes, and give adaptable policies in effectively reducing the illegal behaviors in this article.

Clearly, irrationalities may be witnessed obviously for people arguing for increasing the prisoning period to criminals. For those voting this policy, they may myopically hold that a severer punishment may efficiently eradicate the potential law breakers and prevent established prisoners from making more anti-social behaviors. A harsh penalty, clearly, would threaten common people because they may think about the longer period stuck in jails, and the fierce experience in awaiting an endless sentence. This policy seemingly also works for avoiding those ex-prisoners—some may have the possibility of re-offending laws—to be soon sent back to the normal world, which therefore would purify the atmosphere of the entire society. Whereas the absurdity of this thinking is sourced from the misunderstanding to criminals by using a conventional wisdom towards them. A person with the potential of committing crimes, granted has overwhelmingly been already aware of the consequence of what they may subject to after being arrested. Those extremists would behave anyway, mostly because they have no other way to do, due to the factors of financial burden, living situations, emergencies or urgencies, or sometimes, disparities, or because they are enjoying what they are doing, to violate the authority or convention to get excited. Therefore, the only way to stop them is not to exacerbate the sentences of their imprisonment, but to comfort their mental state and to dismiss the criminal psychology.

Therefore, more positive methods are highly recommended in lowering the crime rate, among which improving the social conditions may be topped on the list. People generally live with no evils, and the dominant reason for them to commit violations is because they have no alternative when considering their hardships in the fierce surroundings—no money for their living, families awaiting financial incomes to fight against famine or to cure diseases, compulsion pushed by other villains, growing hates derived from the distance from the riches or other outperformers. Under this way, solutions focusing on shortening disparities, alleviating the poverties with financial aids, improving the employing rate, or even the open-border for exchanging migrating labors may sound reasonable to prevent a large flow of possible criminals. What is more, education also plays a role in escalating the entire social level. Apart from the aforementioned criminal elements, immaturity, uncivilized mentality, or even the anti-valued nature may also play a part of some guilts, and millions of concrete

examples have shown that nurtures for a brighter direction, or a higher education level are the most effective way for establishing positive common values, forcing mature behaviors and planting the seedling of civilizations.

In conclusion, policies should not be made for endlessly consolidating the bottom line of the punishment to violations, but need to emphasise on contributing the entire social community for preventing the crimes rootedly.

观点类 教育、培训罪犯 VS 送进监狱

Some people think sending criminals to prison is not an effective way to deal with them. Education and training are better. To what extent do you agree or disagree?

范文:

To access whether something is effective or not, or whether a method is better than another, I may have to initially consider how “effective” is defined, and the determinants that leading to one thing better than another.

Many consider the inefficiency that imprisonment may bring about, and the outweighing merits that educations and training can dwarf this kind of punishment because they focus more on the criminals themselves—they may still not realize what have been going on thanks to their behaviors, or they may still become law breakers when released after the sentence. To these so-called “humanitarians”, the enormous time spent in jail seems meaningless because that doesn’t directly raise the awareness of the offenders about their detrimental actions; without proper education, they just waste their energy on serving for years to fulfill the mandates to get their freedom back. It is also true that some prisoners would never get the knacks of being a common person if without proper trainings when out of jail, and that is why education and trainings are highly appealed by some—those means, compared with custodies, are much better at transforming the prisoners by nurturing them with positive mentality and common values, and by providing them opportunities of gaining normal living skills that are extremely useful after their sentence serving; they are the long-term goal as a probation, and for decreasing the violating potentials of, if well implemented, criminals.

Whereas the myopic thinking exhibited in the paragraph doesn’t allow people to see past the effect that prisoning the criminal might bring and robs them of the opportunity to recognize the situations that lies. Prior knowledge, or the premises of something, is the foundation of the reasoning that follows. The imprisonment may not seem like much and certainly not surmount to the deepened disposition to criminals. However, sets of related facts and data points grouped together are the true effectiveness to the stability and the significantly diminished potential hazards to the society. Who is to say that the regular punishment on violators, which may initially seem ineffective to the change of them, did not purify the social ethos and awe the possible criminals? Then comes the so-called “alternative” methodology, which comprises the education and training, though proved important in transforming sinners. What the senseless thinking does is that it distracts us from deeply thinking the factors that determines what sort of treatment should be taken when facing crime commitment. The proper action should always consider multiple situations: severity of the crime that decides whether the treatment is credible to the public, especially to the victims; motivations, whether a crime is forced by reality or just committed deliberately, used to evaluate whether there is a recidivism, etc. It is therefore irrational to just reckon whether one method is better than another.

In conclusion, I would very much agree that effectiveness is manifest for sending criminals in jail, and other methods are not always outweighing because I too share the gift of foresight of seeing the potential and overall situations.

观点类 教育罪犯以帮助他们出狱后找工作以防再次犯罪

It is shown that many criminals have a low level of education. Some people argue that the best way to reduce crime is to educate criminals in prison to help them find jobs when they leave prison. Do you agree or disagree?

范文：

While it is assumed that the key solution to curb crimes is to educate prisoners about working skills, I do not think that it is rational to attribute pervasive criminality solely to illiteracy and therefore regard vocational training as the panacea to constrain the trend.

Indeed, it is easy to understand why this opinion in question is favored by some people. From their perspective, the major reason leading to illegal activities is the lack of schooling: it is true that many offenders embark on the path of crimes (e.g. theft, robbery) because they do not possess the needed degrees or basic skills to find a job; unfortunately, pure imprisonment does little to change their lives after releasing. In this sense, to train them basic vocational skills in prison seems to be a fundamental solution to prevent them from committing the same crimes after release.

However, it is not justified enough to recognize education as the key method to constrain the criminal activities. It is oversimple to attribute crimes exclusively to lack of education. Rather, the worrying trend is a complicated problem which is caused by various culprits; for example, the detrimental impact of media that makes young people aggressive and violent, and the many financial fraud is committed mainly by those with professional backgrounds. In response to these problems, multiple measures are needed instead of solely relying on vocational training. As an alternative, the government can institute laws against violence and obscene contents on TV and computer games, mitigating the possibility of young minds being exposed to offensive contents and therefore translating the plots in the virtual world into reality. As well as the media censorship, social service can play a part in cultivating a sense of social responsibility among those criminals with higher education. Both practices seem to have equally effective influence on crimes as educating prisoners.

In conclusion, it looks simplistic to assume improved education as the best way to limit crimes, whereas other options might be equally effective in tackling the problem.

观点类 犯罪是人们的天性使然

Some scientists believe that studying the behaviour of 3-year-old children can tell which children would grow up to be criminals. To what extent in your opinion is crime a product of human nature or is it possible to stop children from growing up to be criminals?

范文:

Many have questioned whether it is possible to determine a link between genetics and criminal behavior. In my opinion, despite strong resistance in many quarters, there is little doubt that genes play a part in antisocial behavior and we can effectively intervene before antisocial behavior escalates into crime.

It is true that genetic disorders and mental illness have provided explanations for a small minority of offenders with specific conditions. Many genes may affect brain functioning in ways that either increases or reduce the chances individuals learning various complex behavior patterns. Some genes are turned on because of physical, social factors; and some genes that influence directly difficult temperament, impulsivity, novelty seeking, and lack of empathy predispose people to be exposed to environmental risks and make it hard for people to express emotions in what would be considered a positive manner, leading people to engage in anti-social behaviors like enjoy getting lost or doing something crazy just for fun.

Such as it is, as there was general agreement that everyone's behavior is influenced to varying degrees by both genetic and environmental factors, we can divert children from deviant behaviors through fostering positive environment. It has been proven that behavior is molded based on a set of morals, values and beliefs that are instilled in individuals during early childhood, which facilitates decision making throughout the course of an individuals' life. Therefore, intervening early in one's life such as providing instructions and guidance on anger management and emotion language or reinforcing helpful behavior both at school and home will definitely diminish the likelihood of embarking on or persisting in a criminal career.

In fact, it is the combination of both biological and social factors mold people into who they are. Genes only partially dictate the mindset of one that chooses to engage in criminal behavior. Under this conception, viable and effective ways will always be available to prevent children from turning into criminals.

报告类 全球青少年犯罪增加的原因和惩罚措施

In many parts of the world, children and teenagers are committing more crimes. Why do you think this is the case? How should children and teenagers be punished?

范文:

It is true that there is an increasing trend of juvenile delinquency in many countries nowadays. While various hypotheses have been put forward to explain this phenomenon, I would say that this problem can be mainly attributed to the poverty and influences of media, and multiple measures need to be carried out to curb this tendency.

Out of all the factors, poverty stands out as the first culprit contributing to the growing youth crimes rate. Children who live in the poverty are less likely to have access to good schools, which means that many of them lack the minimum degrees and vocational skills to make a living, and therefore might embark on the path of crimes like stealing and robbery for livelihood. Another causation we cannot afford to ignore is the detrimental influence of movies and video games which are saturated with violence. A long exposure to such entertainments inevitably leads to aggressive behaviors, given that adolescents are more susceptible to the false values behind the media.

When it comes to the punishment of youth offenders, I would recommend a combination of incarceration and rehabilitation. For those violent lawbreakers who threaten the public safety, confinement is a necessity to isolate them from endangering the life of others. Meanwhile, for those minor criminal offenders due to livelihood, I would recommend a sentence of community service coupled with vocational trainings if possible, which is conducive to reintegrate them into society and therefore live a settled life.

In conclusion, it looks to me that the pervasive juvenile delinquency is a complicated problem that is correlated to the poverty and media influence, and accordingly a multiple punishment of confinement and education to tackle this issue.

公众号：雅思情报圈

观点类 破坏学校的 14 岁少年应该被送往监狱

A recent newspaper reported that a 14 years boy who seriously destroyed his school got a punishment to clean street instead of sent to the prison. Do you think this is right? Or the young criminals should be sent to jail?

范文:

I would argue in this essay how irrational the claim is to set up the system of punishment on young criminals without deeply considering multiple components contributing to the crime commitment and the appropriation of penalty; to distinguish imprisonment from all types of punishment itself is also myopic.

Whether the reported student should be punished to clean the street instead of sent into prison cannot be rashly decided without considering factors that can lead to the result of the penalty. Before scrutinizing the problem, factors lying under the phenomenon must be witnessed thoroughly: what is the motivation of this anti-social action? Is it a deliberate action or just a careless mistake? To those immature law-breakers, the key to the final punishment is not to force too severe consequences to them. Cleaning streets sounds extremely proper to those unintentionally violating laws because of their childish mentalities, but ridiculous if the damage to the school was done intentionally. Besides, the claim made by the topic is also absurd because it doesn't express certainty in its utterance. The word "serious" is so subjective that it is hard for one to ascertain the content of punishment without a clear definition. The severity of the vandalism is closely linked to what responsibility the student should undertake afterward—cleaning street is not enough if the consequences are irreversible, such as the loss of life, or the deadly destruction.

Moreover, the thinking exhibited in the prompt seems also narrow-minded when it separates serving sentences from reasonable punishments to young criminals. The stereotype in the society considers imprisonment as an "unnecessarily serious" penalty imposed on the young, claiming that it is particularly cruel to give a "life-long" negative record to one who is still experiencing his adolescence. Imprisonment is just the reflection of the level of damage one has made to other individuals, living communities, or societies after the authority has balanced all the factors during the entire crime. Sending the young criminals to prison is aiming to correct the extreme actions, and therefore to stabilize the social living out of hazard and harmfulness. In that case, it is in perfect harmony with the goal of all other punishments. It is neither reasonable to set apart any penalty from others without clear boundaries.

In conclusion, it is the obscurity of the utterances in the claim, and the unreasonable consideration of imprisonment compels me to question the soundness of the topic; I sincerely believe that what kind of penalty is plausible depends on the clarification of all elements in the crime committed.

观点类 青少年犯罪应当同成年人受到同样的惩罚

Young people who commit serious crimes, such as a robbery or a violent attack should be punished in the same way as adults. To what extent do you agree or disagree?

范文:

Recently, a higher proportion of youth are arrested and proven to be involved in serious crimes. Some people argue that it would be too aggressive if these youth who age below 18 are to be charged and treated as adults. However, I personally, believe that depending on the type and severity of the offense committed, the same punishment as adults may have to be imposed.

Most legal systems prescribe specific procedures when dealing with juveniles. They are ordered to complete sentences through probation, home confinement or placement in a foster home. In some cases, social workers are assigned to help juvenile offenders avoid a life of crime by teaching useful living and social skills. All of these is believed to be effective to rehabilitate the offenders and deter them from repeating offenses.

Unfortunately, during the mean time, the juvenile violent crime rates have grown almost twice as quickly as adult crime rates. One obvious explanation is that just because of these specific procedures, juveniles are prone to feel they are practically untouchable by the long arm of the law. This is why harsh punishments rather than mild ones should be implemented especially for those who committed heavy offense like a robbery or a violent attack.

In addition, being punished in the same way as adults will force minors to shoulder the responsibility and consequence and allow them a deep reflection on their criminal acts. Spoiled by their over-protective parents and secured in their insular worlds, juveniles are indifferent to moral codes and unburdened by guilt. Also fueled by their self-centered desires, they will take risks that mature, responsible adults would not dare take under normal circumstances. The intervenes of law enforcement and threats of punishment enable minors to step out of their delusional world and shape them to be responsible social members with correct values.

In short, specific treatments does not seem real to these juvenile offenders, unless they experiences harsh punishments firsthand. Being punished in the same way as adults is as geared towards rehabilitation as it is towards retribution and deterrence.

观点类 政府是否应该监管电影电视节目以降低犯罪率

The government should control the amount of violence in films and on television order to decrease the level of violent crime in society. To what extent do you agree or disagree?

范文:

Violence appears more often in films and televisions, and meanwhile the crimes especially juvenile delinquency are increasingly sever than ever before. Therefore, there are some people who argue that the government should decrease the amount of violence in movies on TV so as to minimize the crimes. Personally, I believe this method is meaningless as this cannot bring about the outcomes that we expected.

First of all, there was no direct relationship between crimes and the amount of violent plots in movies, as the culprits of lawbreaking events are diversified. In other words, most viewers who watch the violent film are adults, and they have a clear distinction between virtual reality and real life. They have a clear consciousness that the exciting parts of the film are just sensationalizing the crimes and realized by the movie's special effects so as to expand the readership and achieve the box office success, which cannot be actualized in the daily life.

Moreover, violence plots have their essential effects in the films. Apart from refreshment and excitement that people can obtain from these films, what I want to mention here is the admonishing effects of violent films. Some violent plot are based on the real cases happened in world war one and two and other real conflicts, and through these plots people can directly be conscious of the consequences of war which are dire and immeasurable ,which cultivates people's senses of crisis and make the modern people who have not experienced the war to cherish the era of peace.

Admittedly, the violence on TV an films can exert unfavorable influences on value systems and behaviors, especially on the young people who are not mature enough to distinguish right from wrong. It is because that if children and teenagers were exposed to massive violent films without the guidance and supervision of their parents, they would be deeply impressed by these film plots, and tend to mimic these behaviors when encountering the similar scene in the real life, by which I mean there would be more likelihood for them to commit crimes because of watching films.

In conclusion, it seems to me that the amount of violence on TV should not be declined. Rather than cut down the plots directly, the government should carefully grade the films according to the amount of violence and pornographic information in the films, thereby defining the age of viewers and ensuring that the children are not adversely affected, just as most western countries already did.

观点类 媒体中犯罪信息是否应该受到限制

Give detailed description of crimes in newspaper and on television can have bad consequences. So information of this kind in the media should be restricted. To what extent do you agree or disagree?

范文:

The violent contents broadcasted by the mass media (the television and the printing press in particular) have been singled out in recent years as a matter of urgent public concern. It has been argued that a detailed description of crime, especially murders, fights, shootings and bombings, should be heavily restricted. I agree on this suggestion based on the following reasons.

In the first place, a complete description of crimes has a distorting effect on viewers' perception of crime, including its nature and impacts. Ongoing exposure to reports on crime scenes has desensitized viewers to the horrors of serious crimes such as homicide. Many TV programmes tend to dramatize the process of tracing criminals. So immersed are viewers in the storyline that few are encouraged to link the crime to a brutal, unsympathetic and devastating act. Meanwhile, newspaper or TV editor gives lengthy reports on recreating the criminal actions but seldom carries out a follow-up study of convicting criminals. This form of representation fails to alert viewers to the fact that no criminal can stay at large and all offenders will be brought to justice.

In addition, the depiction of violence is potentially the primary cause of copycat crimes. The documentary on a criminal or violent act provides people with role models, the ones who initiate most of the acts of violence on television. The regular portrayal of these characters is likely to create a misleading concept that their acts are likely to be acknowledged, and could inspire other criminals about the possible MO (modus operandi). In this case, viewers with anti-social attitudes would emulate the violent behaviour. It is statistically evident that bomb attack has increased by 30% since Russia introduced a programme featuring a notorious terrorist who successfully staged a series of bomb-related incidents.

As suggested above, media violence, including the detailed picturing of violent acts, should be under strict censorship, based on its adverse influence on audience's aggressive thoughts and behaviour.

观点类 法律对人的行为的约束

Today's society is based on laws and rules. It can't function well if individuals are free to do whatever they want. To what extent do you agree or disagree?

范文:

Rules and laws have become an indispensable part of society. Some people believe citizens should not be restricted by them. Personally, I tend to hold a totally different opinion.

A society could fall into complete chaos without laws and regulations. To begin with, our society would run on the right track by adopting effective laws. Since various resources are limited, people may have conflicts with others in order to obtain property. Therefore, the explicit information provided by laws and rules could identify the ownership, which would dramatically reduce the disputes among the public. In addition, laws and regulations could impose the deterrent effect on the public. For example, if people are fully aware of the consequences of disobeying the traffic rules, they are less likely to drive overspeed. In contrast, the absence of laws could result in the malfunction of transport system, which pose a threat not only to drivers on the road, but also the innocent pedestrians.

However, a well-function society could not merely rely on the judicial system, and these regulations should be a means rather than the end. This is because that people may still do something harmful to the society without committing a crime or violate a law. Some people may take the advantages of loopholes of laws to do something only for their own benefits. In this case, laws and regulations is not the solution to all problems in the society.

In conclusion, I believe a sound legal system is vital to maintain the well-function of society despite the fact that it cannot be always effective.

工作类

观点类 工作是人生最重要的事

It is said that work is the most important thing of people's life. Without the success of career, life will become meaningless. To what extent do you agree or disagree with the opinion?

范文:

It is an undeniable fact that people spend most of their time working. Even though some may claim that working sometimes deprives people of their time to enjoy life and relax, I personally hold the opposite view that working still remains one of the most meaningful elements in life.

To start with, money, which is the most direct outcome of work, guarantees a healthy and decent life. Generally speaking, the richer one person is, the better his life quality would be. The way people live, ranging from daily eating and accommodation to the way of relaxation, is closely associated with their earnings. When one is struggling with basic needs such as some costly but nutritious food, then, he may have problem with maintaining the physical well-being, not to mention other higher demands like travelling abroad.

Furthermore, successful career means not only sufficient financial support, but also spiritual fulfillment. To be more specific, people who can become experts and gurus would normally engage in fields that pertain to their own strengths and personalities and this tend to bring the sense of engagement and achievement instead of the superficial happiness of hedonism. In other words, for successful people, working is not only a way of earning money, but also a way of self-actualisation. For example, Leonardo Dicaprio's ambition and passion and for acting can be obviously observed in many of his renowned screen works. Likewise, without the interest in basketball, Yaoming would never have become the international sports star.

By way of conclusion, I once again reaffirm my position that the blossom of career functions significantly throughout people's life given its contribution to both life quality and self-actualisation.

报告类 难以达到工作和生活平衡

Many people aim to achieve a balance between work and other parts of lives, but few people achieve it. What are the problems in trying it? How to overcome it?

范文:

The balance between life and work has long been a problem that exhausts working individuals in this century. While various hypotheses have been put forward to explain the issue, I tend to analyze this problem from both individual and corporate aspect and provide some possible solutions.

From my perspective, why the majority fail to handle the relationship between companies and families is a symptom of problem to which I see the financial pressure as a main answer. Living in a consumer society, many individuals are inundated with a multitude of tasks, most of which are inextricably bound up with money, whether these be mortgage, private cars, medical insurance, and tuition fees for children. Only by pushing themselves to be workaholics can they earn more money to pay all bills.

Another problem that traps employees in the office might sound ridiculous but true – many bosses tend to equate the number of working hours with the performance of their underlings, which leads to the curse on employees in many businesses. One notorious example is the 996 mode that irritates millions of IT practitioners in China, meaning 9 am to 9 pm, 6 working days a week. What a pipe dream to talk about family life in a world moving in this direction!

Fortunately, this does not mean the end of the world for working adults and their families, while there are some measures we can implement to liberate employees from toiling. One option is for the government to initiate policy of tax reduction to those live on tight budget, therefore they might less likely to hunt for another part-time job just for more money. As well as a tax policy, a more stringent law against exploitation should be legislated, which will prohibit compulsory long working hours. Even awareness campaigns can play a part: the media could contribute to publicizing the long-term effects of work-life balance on improving work efficiency and productivity.

In conclusion, it looks to me that the inequality between work and private life is a complicated problem that can be attributed to finance and cognition, both of which need to be handled by the joint efforts of administration and the media.

观点类 更换工作和住所是好的还是不好的发展

An increasing number of people change their career and places of residence several times during their life. Is it a positive or negative development ?

范文:

Many people today tend to have a varied job history and also move to different places during the course of their lives. This can advance their career although sometimes it is difficult to maintain their relationships with friends and neighbours.

People who change jobs or move house from time to time may become well-rounded and knowledgeable, since they can meet new friends and acquire a great variety of skills. For example, they may work for a multinational company, where they can improve language skills with the help of colleagues from other countries. The new employer may use a different computer system, allowing them to upgrade their computer skills. With such skills and experience, these people can handle complex problems more easily and gain more opportunities for career progression.

Another reason why people make career changes or move to a new home is that they intend to experience different cultures and lifestyles. They may enjoy working in companies which place importance on teamwork, because they can work closely with supportive colleagues to achieve targets. It is also interesting to live in a neighborhood where they can gain access to facilities to do exercise regularly, and amenities such as clubs, pubs and cinemas for different social activities. By embracing these changes, many people can live a colourful and rewarding life.

On the other hand, people may have difficulty in maintaining a strong relationship with friends or neighbours, if they do not have a steady job or live in a place for a long time. The lack of communication with colleagues or those living the next door can be a problem because they do not visit each other or eat a meal together. They cannot cope with stress easily due to the fact that they cannot take advice from others or share their feelings with others. They are not close, and do not have a sense of community.

In conclusion, moving to another place or working for another company is a good choice for people in terms of career advancement. On the negative side, it is not easy to create a closely-knit community if everybody leads a nomadic life.

混合类 不断换工作的原因

An increasing number of people are changing their careers during their working time. What causes this trend and is it a positive or negative development ?

范文:

Many young people frequently change their jobs either for advancing their career or simply for making more money. This may bring more opportunities and a higher income to them, although sometimes it prevents them from developing expertise.

Some people search for a new job because they believe that they deserve high pay with their skills. They might start their career as front-line employees in restaurants, but after working several years, they can accept the offer of a new company to work as managers who know how to run a restaurant, divide work and manage staff, as their experience accumulates. Some people who studied accounting at university may handle bookkeeping when they graduate, but they can change jobs later and work as accountants to manage a company's accounts, make investment decisions and prepare financial reports. These new positions provide a higher salary, which is important for them, especially when they have to raise a family.

Young people who have ambitions and intend to expand skills set also switch jobs from time to time. If they have been doing clerical work for a number of years, it makes sense to look for new positions in which they can improve communication skills by marketing products to clients. Those who work as teachers at school can apply for a management position in another institution to improve management skills. Possessing many skills is important in the modern world, where the competition is fierce and the business environment is volatile.

On the other hand, those who change jobs frequently cannot develop expertise and earn a high income. Companies would not recruit them, since these job applicants may not have a well-defined career path. It is also difficult for these people to show an in depth knowledge of how services are provided, how to address clients' needs , and what skills are required for performing a task. They cannot earn a decent living, receive a pension or get promoted.

In conclusion, smart career moves can benefit working people by increasing their earnings and offering more opportunities for career advancement, but changing jobs frequently may leave a bad impression on potential employers.

范文 2:

Job hopping, nowadays, has become increasingly prevalent in our competitive society. From my viewpoint, it is both personal ambitions and the flux of industries that have contributed to this phenomenon with positive social ramifications.

An attempt to fulfill personal requirement and potential is likely to be a main incentive that galvanizes many young talents to change their situations for a better living standard. Exposure to heavy stress and fierce working competitions encourage youngsters to search for more chances in other fields, which provide them with not just higher salaries, but also a variety of vocational skills and experience to keep them abreast of current and future booms.

Technological development is also responsible for the frequency of this tendency. The modern world is moving in a direction where routine tasks are automated, a consequence that millions of positions are inclined to be replaced by advanced machines, particularly in those labor-intensive industries. Unfortunately, those laid off workers are forced to take chances in a new realm.

However, when it comes to the influences on society, two positive factors are supposed to be taken into account. In terms of business level, the talents from different backgrounds can be considered as new blood for many traditional industries, bringing innovative ideas and versatility to some conservative workforce. On individuals, an opportunity in a strange and brand new field turns over a new leaf for their personal careers, in which they would not just gain job satisfaction but also fulfill their potential on greener pastures.

In conclusion, a wide range of causes are associated with the increased demand for job hopping and this shift brings more benefits whether for individuals or our society.

公众号：雅思情报圈

报告类 人们不再依赖一份工作生活

The world of work is changing rapidly. Working conditions today are not the same as before and people no longer rely on taking one job for life. Discuss the possible causes for this change and give your suggestions on how people should prepare for work in the future.

范文:

I would discuss in this essay about the reasons people change jobs frequently, in terms of the property of different vocations and the focuses on different periods of one's life, and give suggestions on their major choices.

Timing should be one of the factors that compels people to leave from their jobs in certain areas. Occupations like models, secretaries, pilots, athletes, receptors or guest attenders, or even in this fast pacing era, computer programmers, are all facing the risk of being out of age after they grow older. This category of jobs, on the one hand, requires for some particular characteristics of those practitioners—most are based on physical situations, like outlook, physical or body powers, etc.—that makes people soon exhausted after a few years, meaning they are losing their beauties, or no longer good at their bodies or energies, or wearing out mentalities, which is why they have to meet the fate of being dismissed when they have reached a certain age. Considering this, people have to thoroughly think about the systematic path of an area before making decisions on the major they choose to further their career abilities, and make sure that what they are learning can develop a deepened, or wide pace after they are occupied for years.

There are also people choosing to alter their vocational lifespan for different purposes in different stages of their life. That is to say, people would focus on different consequences of what a job would bring about to one's both career path and daily life. A challengeable job may perfectly fit the young who are awaiting the multiple possibilities, pressures, adverse conditions, or even the sorrows or bad moods jobs may endure them, since they would love to experience more in their early years, while it may not be on the top of list of a mid-age worker, because what these type of people need contemporarily is to stabilize their life, to share some of their energy in accompanying their families, or to make sustainable development in terms of the position or incomes. Hence, people may be out of the aforementioned "challenging group", and move smoothly towards the "stable matrix". According to this, I rather suggest that before starting campus life, one should meticulously formulate their future blue print regarding whether the future career of a major would face challenges all the time, and whether it would be possible to be gradually smooth and sustaining after a certain years' struggling.

In conclusion, timing and focuses on jobs may promote differences on people's working situations during their entire lifespan, and the vocation option should closely follow the systematicity and future development of individuals.

公众号：雅思情报圈

双边类 随意选择工作,还是现实为上?

Some people think young people should be free to choose his or her job, but other people think they should be realistic and think more about their future. Discuss both views and give your opinion.

范文:

Whether the youth should make their career choices according to what they enjoy doing or in light of monetary values or future development is a frequent topic of discussion. Although they cannot afford to ignore certain realistic factors, personally, job satisfaction is overall the single most important factor to consider.

Admittedly, the ability to pursue careers may hinge on the financial situation as some career paths require special schooling and qualifications and this is sometimes expensive. Furthermore, youths should take into consideration if the career path they are choosing will provide them with an acceptable level of financial security. Namely, whether the take-home salary will be enough to support themselves or their family or to cover their health insurance and retirement options as well.

However, such realistic factors put too much pressure on people who are trying to choose the right career. I believe, the youth are entitled to make career decision according to their own will. Firstly, more values could be attached to job satisfaction. If these realistic considerations are forced on them, they may probably end up being miserable. As average person works about 40 hours a week till the age of 40 years – approximately 80,000 hours of their life will be spent on their work, which does make it important to do the job they love, find one that is a good fit for their interests, aptitudes, work-related values and personality type. In this case, they are more likely to prosper in their work as they enjoy the majority of the job duties.

It might be for some people, work is a necessary evil, but there are also instances where people choose a career more than a means of livelihood, if they are allowed to make their own choice.

公众号：雅思情报圈

观点类 恪守职业比频繁换工作更容易感到满足

People who decide on a career path early in their lives and keep to it are more likely to have a satisfying working life than those who change jobs frequently. To what extent do you agree or disagree?

范文:

It is argued that, compared with frequent job hoppers, those who establish a career goal earlier and stick to the target onwards are more likely to be contented with their work. From my perspective, I tend to see this assertion as an incomplete part of the entire picture, while the job satisfaction is not an either-or issue that we can jump to a conclusion recklessly without scrutinizing all possible contributing factors.

Indeed, it seems to make sense why many people tend to venerate the persistent career mode over multiple working paths. In the eyes of those jumping on the bandwagon, the most frequently celebrated cases of successful business icons all seem to prove the logic, whether these be Bill Gates from Microsoft, Mark Zuckerberg from Facebook or Jack Ma from Alibaba – none of whom is not the manifestation of years or even decades of adherence to the goals established in the beginning of their careers.

Plausible though the logic seems, I would say that it is simple-minded to prioritize one working mode over others: the protagonists lauding for staying on single working path are oblivious to the fact that the so-called 'satisfaction in work' is not an objective notion than can be calibrated by any specific standards. Rather, I would see the work gratification as a subjective perception that is inevitably correlated with various determinants; for example, extrinsic motivating factors, or personal attitudes towards what is happiness of work. Oftentimes, the ongoing business trends require working adults to change their career paths to a new direction that might be more aligned with their prospects. At an individual level, there do exist some people who obtain sense of achievement by embracing new challenges and opportunities in new domains.

With regards to this, I am convinced that a satisfied working life is a complicated concept that does not necessarily hinges on single career path, but in many cases can also come from a more colorful career spectrum.

观点类 无法享受工作时不如不找工作

Some people think that it is better for people to be unemployed than people to be employed but they do not enjoy, to what extent do you agree or disagree

范文:

The claim made by the topic fails to be persuasive because enjoyment is not the only thing one should care about when finding a job; I would argue in this essay how unreasonable it is to await jobs that only please a person without considering other contributing factors.

Chances are the enjoyment in doing a job is more important than finding a job temporarily for people. It is true that sometimes one should wait for an enjoyable job if there is no better option, because the fulfillment sensed in a job is extremely essential to those ranking the working achievement and the working performance on the top of their lists. These high achievers can wait for a job that would definitely be performed better only when they really are satisfied about what they are doing, and then make great improvement for both the companies and their own career lifespan; once they cannot find their values in their jobs, they cannot make self-happiness and only see darkness in their foreseeable future. That, ergo, is a good reason for one to wait for a while for their perfect hunting coming along.

But this type of waiting is highly restricted under such circumstances: they should firstly be self-esteemed that they are with the capability of finding their destinations anyway, where they are able to show their talents and witness their satisfaction; they secondly should also worry little about their physical life, in which the economic situation is good enough to give them a chance to maintain their waiting. That means, the unemployment until finding a true love of job only works when the potential practitioners have the preference and ability in certain occupations, and their realities are not that urgent to find a job to sustain their living. Those factors, together with the enjoyment of the jobs, jointly contribute to what kind of occupational condition one should choose—to omit those practical situations but just to wait for a lovely job is certainly not rational, but sometime, myopic.

In conclusion, even though the unemployment is a good idea for some to consider this as a “gap period” until they find an enjoyable job, it is not always the proper choice for anyone without considering other determinants.

观点类 通过面试了解员工

Some people think that the interview is an unreliable way for a company to recruit new staff, and there are better selection methods. To what extent do you agree or disagree?

范文:

Though employed as an important approach in the process of recruitment, interview is nowadays frowned upon by many as unreliable in evaluating the overall quality of applicants, whereas there are more effective methods. From my perspective, it is simple-minded to venerate other measures over the interview without scrutinizing all contributing factors.

Indeed, it is easy to understand why the perception has crept into the thinking of many people. From their perspective, a few minutes of communication is far from enough for employers to fully recognize the background of the candidate – whether it be their expertise, or other features like sense of cooperation and team spirit. Plausible though the logic seems, the protagonists of this are oblivious to the fact that the final job offer does not descend solely from the interview. Quite the contrary, to hunt for an appropriate candidate for a position is a momentous decision that is subject to a repertoire of scrutiny, from the evaluation of applicants' education background to the investigation of their former working experience. In this respect, it does not make sense to attribute the credibility of recruitment to interview.

Also, a stronger argument against the opinion in topic is the so-called 'better selection methods': which approach can be deemed more effective in evaluating job applicants is an amorphous notion that varies by discrete requirement of different positions. For some scientific research-based work, it does make sense that the academic performance, or the research achievements of candidates are more persuasive than a brief talk of 20 minutes' interview. But for positions like customer service or sales representative, which emphasize more on appearance and interpersonal skills, it is the face-to-face communication that wins the heart of employers.

From what has been discussed, it looks to me that it is irrational to deny the justification of interview without considering the practical demand of recruitment in real business world.

观点类 年轻人做领导

The leaders or directors of organizations are often older people. But some people say that young people can also be a leader. To what extent do you agree or disagree?

范文:

It is common for enterprises to have seniors as top executives nowadays. However, there is an argument that young people should also be offered the opportunities to be the leaders as the age should not be the glass ceiling that bars them from upper management in large corporations. From my perspective, I agree with this idea.

First of all, young leaders, especially those employed in high-technology companies, are easy to keep pace with the rapid changing market. Admittedly, compared with senior employees, they do lack experience of the past, but facing this rapid shifting market, their inadequate experience can be in turn seen as an advantage, as being in the same age of the targeting customers, they can understand the current popular tendency and are less likely to be inhibited by self-consciousness. Therefore, they are able to absorb the latest information and use their lateral thinking to make adaptations to meet the demand. Besides, young people have more abundant time and vigorous to be leader. Being managers means catering enormous tasks simultaneously, and as most of young people have not been married and formed their family, they can devote themselves to their work and maximise their output, which is impossible for older people.

Undeniably, when facing an emergency or a dilemma, compared with the aged leaders, the young generation tend to be less responsible and considerable, resulting in impulsive decisions due to their immaturity. Consequently, organisations might be at risk. However, young candidates who have the potential to be the manager can be first recruited as the management trainee, and after having the professional training ranging from six months to five years, they are sure to have the capability to deal with diverse situations.

In conclusion, despite the defects of young managers, young people are eligible for leadership. Therefore, organisations should be encouraged to employ the young generation in top positions.

报告类 青年离开老家去城市学习工作的原因利弊

Young people are leaving their homes from rural areas to study or work in the cities. What are the reasons? Do the advantages of this development outweigh its disadvantages?

范文:

It has been long been a prevalent trend that the younger generation in villages is pouring into cities for study or work. While various hypotheses have been put forward in trying to explain the phenomenon, I would see this trend as a result of disparity between the rural and urban area, and I am not optimistic towards the ramification of the tendency.

Firstly, the flow of population is an issue to which I see the better educational resources in urban areas as an answer. It is true that most prestigious universities are located in cities, which plays as a magnet to attract young minds who are thirst for knowledge. Also, the metropolitan area is reckoned to have more job opportunities in the eyes of country boys and girls. The urbanization trend has boosted the demand for the workforce in diversified sectors, from cheap labour in manufacturing industries to higher educated talents in high tech businesses.

Some may argue that young immigrants from the country provide the needed workforce in many industries, while many of them who achieve higher degrees in universities contribute more to in fields like finance and IT. However, What I am concerned is the dark side of the gold rush. One problem we cannot afford to ignore is the village decay following the brain drain. With young people leaving for big cities, villages are inevitably faced with problems like ageing population and underdevelopment, which in turn exacerbates the disparity between two areas. Meanwhile, after decades of population input, the current situation in many cities is not as prosperous as before. The dramatic rise of young population has been exhausting the education resources in cities, resulting in intense competition in schools. The labour surplus also aggravates exploitation in many businesses, leading to long working hours and lower wages.

In conclusion, it looks to me that the emmigration of youngsters from the country to the city is an irreversible trend. However, the lights in big cities are not as bright as they used to be.

观点类 新技术的普及使青年比老年人更有求职优势

The increasing use of technology in the workplace has made it easier for young people to get work and hard for old people. To what extent do you agree or disagree?

范文:

Some people claim that the computerized era makes the younger generation more competitive than their senior counterparts in job seeking. While it maybe the truth in the case of some businesses, I would say that there are many other fields where old people have their unique strength over young rivals.

On the one hand, in some technological industries, young job seekers who can manipulate computers or software do have more opportunities than old people. This is particularly obvious in positions like programming and IT engineering, where the proficiency in computer know-how and potential learning capability are the key consideration for employers. That is why there are usually thresholds set for the age of applicants in these occupations, given the general belief that young people are more adapted to the ever-changing trend of new technology.

On the other hand, there are other jobs which do not require proficiency in technological skills. The sales, for example, is one of those positions that attaches more importance on experience and business connections, both of which are the advantages of senior employees, as it takes years to accumulate the knowledge and establish network in a certain field. The same is true for consulting companies, where the profound insight from an experienced expert is far more reliable and persuasive to clients. The last fact we cannot afford to ignore is that in almost all countries, whether these be developed or developing ones, it is the elderly who take the position of president, no matter how much the government values new technology.

In conclusion, it is undeniable that old people are eclipsed by young talents in certain technological positions, but it seems to me that senior citizens still have their role to play in many sectors in this high-tech age.

范文 2:

It is sometimes argued that modern technology has been giving the edge to young generations over older people when it comes to getting employed. I agree with this idea to some extent, but would argue that this situation only exists in certain industries.

Undoubtedly, the development of modern technology has been putting older people out of work for the past decades. For example, in the highly technology-oriented Internet industry, employers prefer to hire younger, more energetic programmers who not only can learn new coding languages faster, but also can work for longer hours without having to go home and take care of families. Similarly, younger content creators who are more familiar with modern pop-culture and mindsets of youngsters in new media industry, which is also a product of modern information technology. In these industries, years of work experience is often not valued as high as energy and capacity to keep learning about new techniques and absorbing new information, which is a privilege that only young people have.

However, there are traditional industries where technology simply cannot replace years' accumulation of work experience. For example, no matter how fast medical technology has been improving, experienced doctors and surgeons are still valued way higher than young medical interns who are still working on their doctor's degrees; and parents are often more willing to pay for experienced teachers to teach their kids rather than young ones. Even in the new industries mentioned before, programmers and content creators are also able to make it to higher positions in the company with management skills after years of working.

In conclusion, I would argue that the advantages given to young people by technological development are only valid in certain occasions, and older people can always find their own strong suits.

公众号：雅思情报圈

报告类 年长者与年轻人同时竞争工作

Older people who need employment have to compete with younger people. What problems does this cause? And what are the solutions?

范文:

There are always problems when multiple age groups are put into one giant talent pool. I would discuss in this essay about the issues and the possible solutions to alleviate them.

The fierce competition between different aged employees provokes far beyond the dissatisfactions and mutual pressures from the both sides; a vicious circle is gradually formed during the process. Chances are that young candidates might fail to be selected due to their lack of good working experience or immature job-hunting capability when compared with those seasoned finders, and are then become the “left-behind” talents waiting in the employment market. They then may have to either strive to be employed by their second-planed company, which of course, is also largely with disappointing outcome, or degrade themselves doing the jobs that require far below their abilities. The strong feeling of imbalance during their vocational life is likely to make them the mentioned “older people” after years, since some would possibly leave their tedious and dissatisfied career path and then push themselves back into the talent market to compete with newly potential employees. Such is the foreseeable scenario in front of the already harsh job finding situation, in which there are twice likely the result that place hunters never find their dream work and destabilize their vocational life span.

The trend is inevitable in almost all societies, but there are still ways, though not that efficient, to relatively alleviate the situation. Multiple efforts are to made jointly in both developing the competitiveness of the younger candidates and increasing their degree of job satisfaction, and what is more, in encouraging more of the potential employees to become employers themselves. Employability is always possible to be fostered during one’s academic life, and universities, vocational schools or even high schools can prepare their future graduates with those competences. Those hunters are then less awe of their future vocations and would better their combination between their academic knowledge and related vocational utilization during their probation. Corporates are also playing their roles in systemize their bodies in terms of the promotion channels, to make sure the overwhelming staff can have chances to get high levels and to try various job contents; such possibilities can somewhat stabilize those once mismatching employees. There is also an awareness that entrepreneurship is highly recommended in this much open, diversified society, where opportunities prevail the economic environments. Job finders are truly welcomed to set up their own career, because this may on the one hand resolve their employment problems, and provide more positions for talents on the other.

In conclusion, the hardship presented in the talent market filled with both older and younger applicants should be seriously considered, and methodologies can be figured out to better the employment environment.

范文 2:

These days, city has become a front line in a generational battle for jobs, as older workers increasingly compete against younger applicants for positions. There are some consequences caused by this phenomenon, and possible approaches could be adopted to address the negative consequence.

The fact that nowadays many people working longer, well past retirement age will inevitably causes some social problems. For one thing, with the increasing number of older population in the job market, the existing job positions may not be sufficient to meet the growing demands. For another, older workers will experience occupational stress and strains when there is a mismatch between the requirements of the job and the capabilities of workers. Especially, when it come to the job which have implications for physical stamina and frequent mobility or constant updating of knowledge and technology, the ageing process will have potential for reduced performance.

There are some measures to mitigate the challenges of an ageing population in the workplace, as retirees often complain that employers improperly favour the other. In this era, young generation tend to have an edge over older workers, as they grew up using computers, automated tools and software applications for performing most tasks. It is advisable for authorities to provide training arrangements for older people to keep updated with new and emerging software and Internet tools. There is also a clear need to maximize economic output and taxation income, to support an ageing society with better social care and on pensions.

In conclusion, older people have long coexisted with a much younger generation in the job market. Although this does not measurably increase the unemployment rate, in the depressed realities, tensions will swell and actions to prevent the alarming trends turning worse may well be contemplated and implemented.

观点类 老年人可以继续工作

Some say old people should continue to work, if their condition allows them to do so. To what extent do you agree or disagree?

范文:

The latest census conducted last year in China is expected to offer strong statistical support for the country to promote long-term and balanced population development. However, according to the data showed, the population of Chinese people on the mainland aged 60 or above has reached 13.5 percent of the total population, by which I mean aging population will be China's basic national condition for a long time. Therefore, facing such challenge, there are some people who argue that old people should continue to work as long as their physical conditions allow them to do so. Personally, I partially agree with this idea.

First of all, postponing retirement can greatly relieve the social pressure brought by the aging population. Currently, many developed countries in the world also have entered the stage of aging population, which means that the financial burden of sandwich generation is soaring as there are more elderly people who need to be supported by tax. Delaying retirement, however, can greatly relieve this pressure as suspending the retirement age of employees means increasing the number of taxpayers and reducing the expenditure of retirement pension for them simultaneously. Therefore, compared with encouraging fertility to alleviate the social pressure, the effect of delaying retirement is much more immediate.

Besides, from the individual level, delaying retirement is also a reasonable and suitable measure for the current society. With the enhancement of living standards and medical advances, the average life expectancy of the population has generally extended in recent years, which means that people aged 55-60 are generally in good health and can still take full-time occupations. At the same time, middle-aged people nowadays are still facing enormous economic pressure, including mortgage, bills, tuition fees and other expenses. Continuing to engage in a relatively high-income full-time job can relieve the pressure of daily life.

Admittedly, workers aged 50 to 61 expect to delay retirement might restrict openings for younger workers. Compared with young people with no work experience, companies prefer to continue to employ elderly people with decades of experience to reduce training costs and benefit from resources such as contacts accumulated by these people over the years. However, the young people's innovative ability, high-quality education background and sufficient experience also increase the value that the elderly cannot provide in the field of work.

In conclusion, it seems to me that delaying retirement is an inevitable trend in the society of that year, and it has great advantages, mainly because this can alleviate the pressure of population aging and effectively solve personal financial difficulties.

利弊类 不能因年龄拒绝求职员工

In some countries, it is illegal for companies to reject job applicants for their age. Is this a positive or negative development?

范文:

The age discrimination in the workplace, especially in the job interview, is now forbidden by means of rigid laws in certain countries. When talking about the merit and demerit of this development, I think the former may weigh far higher than the latter.

The benefits of this tendency can be perceived in many aspects. First and foremost, this seemingly harsh practice can ensure the fairness in the workplace and render individuals a sense of security. To be more specific, age is not necessarily an indicator of inferior ability or potential and the determinant of one candidate's hiring conditions should be the qualified competence. If an elderly applicant who is apparently possessed with superior capability for some position is just refused on the basis of his or her age, it would be a huge loss for the company by having a small pool of workers to choose and meanwhile lead to a potential strain for the public resources of the country since the ageing population can be a dependent group. Therefore, the elimination of ageism can avert the anxiety and create a fair platform for talents-displaying in the process of job-seeking. Moreover, a dynamic multi-generational workforce is more likely to stimulate the optimum performance of one company. This is essentially because the wider age range of employees naturally goes with more diverse skill sets and viewpoints, which can sometimes be complementary to form a virtuous circle under reasonable guidance so that the employer can take full advantage of their respective strength of distinct age groups.

On the downside, the removal of age limit might engender some risks in some cases. It is evident that in some physically-demanding industries the absence of age limitation can be hazardous for employees. For example, if the aged applicant is appointed to accomplish some tasks requiring high-intensity physical activity, this kind of mismatch may put his or her life in danger, let alone the task achievement. The concern of job productivity may also make the employer value the proper age of employees.

To conclude, I believe it is worth advocating for countries to have a law against age discrimination considering its benefits to both job seekers and employers. Meanwhile, some employers in physically-demanding industries should also offer some detailed job description including age limit so as to mitigate the risk.

观点类 工作是否应该男女分工

Some people think that men and women have different qualities. Therefore, some certain jobs are suitable for men and some jobs are suitable for women. To what extent do you agree or disagree?

范文:

The gender has long been referred to as a parameter to assume the quality between men and women, and therefore employers tend to take it as a criterion in recruitment of certain positions. Personally, while I don't mean to deny some differences related to genders, I have to say it is simplistic to recklessly deny the justification of either gender in certain positions solely based on our conventional perception.

Some devotees of the prejudice in question might argue that there do exist a physical dichotomy between women and men, notably in features like strength or endurance (not to mention the possible maternal leave of females in their future careers), which makes it difficult for many sectors to overlook the factor, for example in some labor-based positions as construction workers or other jobs requiring patience like housemaids. I suppose it is such an apprehension that compels many self-proclaimed PR experts to incorporate gender as a standard for recruitment.

Plausible though it may seem, those who jump on this bandwagon of gender difference are oblivious to the fallacy behind their assumption – there is no inherent causality between the premise and the conclusion. In other words, whether or not a job is suitable for certain groups is not an either-or question to which we can jump to an answer solely based on the so-called common belief. Contrary to what it may appear, to evaluate the capability of candidates for any positions is a task of great complexity that incorporates a range of extrinsic determinants. For example, we should not lose sight of the trend of automation in many dangerous sectors, making the role of human in these positions no more than an operator behind consoles. In this respect, it doesn't make any sense to focus on gender of applicants if what we need is someone to operate computers. Even for some tasks that cannot be accomplished by robots, it is imperative to recognize the individual quality regardless of their gender – compelling examples include, but are not limited to, male nurses and female pilots for fighters.

In conclusion, it is irrational to set a threshold of gender for job applicants simply based on our personal presupposition of the quality between men and women.

范文 2:

There is no doubt that men and women are endowed with distinct biological characteristics. Some assert that due to this disparity, they should share different division of labor in society. From my

perspective, I think this view overlooks important factors of this issue and I find their view unconvincing.

Admittedly, it is conceivable that natural traits may enable men and women to enjoy some strengths in different fields. Compared with males, females seem to have higher likelihood of innate superiority in caring and nurturing and other jobs related to domesticity, considering most of women are hard-wired to be kind, patient and caring. By the same token, some specialties are traditionally attached with the role of males. The macho-image is active and aggressive with the advantage in strength, which shapes a conventional concept that men are supposed to be the decision maker who earns bread and butter for the family. However, this gender stereotype is obsolete with increasing number of women making their contribution in a wide range of professions.

The first and foremost point for my stand is that the views based on generalized characteristics of men and women are often inaccurate. There are always exceptions to every rule despite some traits typical of men or women. Conventional gender roles may not be suitable for every single person, for not all women are physically weak, just as not all men are terrible house worker. Therefore, a man or woman should be equally offered opportunities when he or she pursue a career which is traditionally dominated by the opposite sex.

It might also be emphasized that the coexistence of both males and females in a workplace creates a sense of balance. Given the different ways of handling things from the two opposite genders, the presence of both groups in one field can also be viewed as opportunities for innovation and the discovery of more effective and efficient work practices. On some occasions, one gender's weaknesses can thus be converted into strengths.

In conclusion, I reaffirm my proposition that the conservative stereotypical ideas about men and women are not appropriate and employees in both genders should be valued as an asset in any industry.

公众号：雅思情报圈

双边类 女性能否在警察军队中担任男性一样的角色

Some people believe that women should play an equal role as men in a country's police force or military force, while others think women are not suitable for these kinds of jobs. Discuss both views and give your opinion.

范文:

Never has the discussion of gender equality ceased in many fields of the society. Now it is over to the military and police sectors to face the conflicting view whether women are entitled to the same opportunities as men. To me, I would support the opinion that women are not suitable for these positions due to the unforeseeable pitfalls.

Theoretically speaking, it is easy to understand why those feminists assert that women deserve the equal role as their male counterparts in armed forces. The first factor that contribute to this assertion is the computerization in troops and police forces today, meaning that many tasks are accomplished by recruits who sitting behind computer screens rather than muscle-bound men in helicopters, a trend that makes it possible for females to have their role to play. Also, other positions, say, medical service, intelligence analysis or supply management, do not have specific physical thresholds concerning genders.

However, this is not how it looks in the eyes of opponents, who point out that the feminism does not work with all positions in military and police forces, while there exist some potential problems. For example, the combat units have stringent entrance requirement, such as strength, body power or endurance, most of which cannot be achieved by female members due to their physical disadvantage. Given this, it is not feasible for women to pass these examinations which are beyond their physical limit.

Another factor that should not be neglected is the potential maternity leave of female members, which is commonly seen in ordinary business world but does not work with these special sectors, which are pivotal to national security. How would a combat crew deal with an emergency with half of its member on parental leave?

In my opinion, although it is the popular trend that women are playing increasing important role in many aspects of modern society, it is not the time for all military and police units to cater to such trend when considering its negative impacts.

报告类 刚毕业新员工缺乏基本人际交往能力

Some businesses find that new employees finishing education lack basic interpersonal ability such as working with others as a part of a team. What do you think are the causes of this problem? And how to solve this problem?

范文 1:

I would argue in this essay for the reasons leading to the lack of interpersonal skills among young graduates who are just pushed in their occupations in terms of the limitations of current schoolings and the social situations, and possible solutions in dealing with this problem.

The problem mainly sources from a variety of factors, among which the role that schools are playing on those young employees may have to be made a deep thought first. Undergraduates, or those with even higher education, are mostly imparted with the mentality of accomplishing their study independently—this may be more evident in today's society, where students are generally isolated more due to their new way of dealing with problems by means of computers and social networks—for their own benefits in their colleges. Knowledge is always acquired directly by teachers' "top-down approach", or resources gained from internet or textbooks; papers are authored by at most one individual to guarantee the quota for every student and no mutual reference. So does the exams, during which students are only allowed to work out problems themselves, which can therefore testify the "true knowledge assimilation" of different students. The habit nurtured in their study lives may become the main reason they are not used to cooperating with their surroundings later in their occupation. Apart from this, the harsh reality in the modern society may also be the culprit precluding those newcomers from being effective in a working team. Young generation is experiencing unprecedented hardships: the ever-increasing unemployment that represses the new graduates, the over-saturated talent market that drives the job waiters anxious and the ever-changing living paces that provides uncertainties. The potential practitioners, ergo, have to make themselves outstanding enough to be chosen by their dreamed vocations and to struggle with their lives inside the extremely competitive surrounding. One may, sadly, necessarily outperform their rivals rather than establish teamwork in their daily education, since that would be the only path leading to their own success. It is also too much for them to finish their change to become a good cooperator, to be less combative, to compromise themselves on others, or to merge their own prodigies for contributing a team soon after they are involved in their jobs.

What can be done to those staff is not only to make a fundamental alternation of the education system, but the interim actions taken after recruitment by companies. Students would be less in awe of working with others provided they were taught to solve problems as a workshop within a group, which can be totally achieved by changing the teaching strategy and the role of the teacher in class. Knowledge providers of a course should never solely be the teacher somewhat; learners are also a

part of the cohort to inculcate themselves by coordinating each other under some guidance on their way to find out answers, and this can be a significant step in preparing those undergraduates with a psychology of teamwork. Interpersonal skills are also worth a trial to be cultivated via setting related activities—outdoor games, or classroom interpersonal communications, etc.—to make sure the majority of those students would be willing to establish relations with their colleagues after leaving school. Besides, the policy of team building inside a business is highly recommended for planting the team spirit inside the ideology of the newly recruited employees through reasonable number of activities, trainings, or even parties or other forms of gatherings, and this provides opportunities to deepen their bonds with others in terms of job accomplishment and sometimes, emotions, which are always a key element contributing to one's occupational stability.

In conclusion, the traditional educational methodology and the lack of consciousness of cooperating with others among the newly graduated employees are negatively linked with their teamwork capabilities, but this can be effectively resolved by the multiple efforts from education system, companies and individuals.

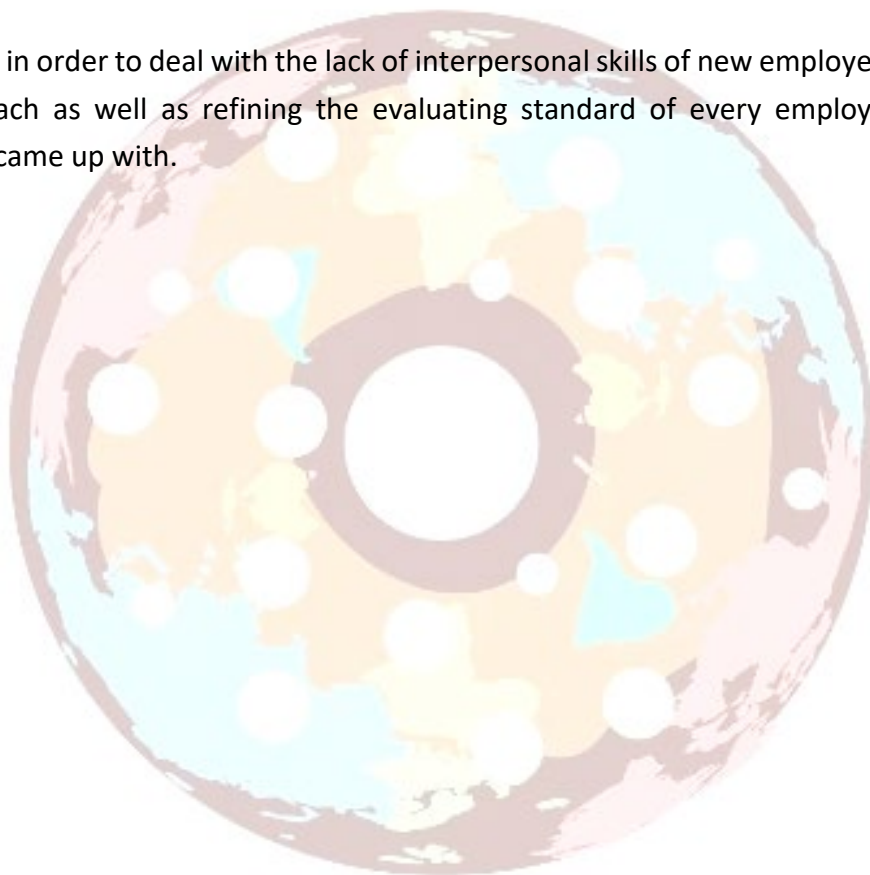

范文 2:

Every September is a time for large-scale recruitment, and young adults, especially fresh graduates, are striving to find a suitable occupation. However, some companies find a dilemma that new recruits generally lack interpersonal skills. This essay will first analyze all the possible causes of the problem and then come up with several feasible solutions that could be adopted in order to avoid the aggravation of the situation.

The first reason related to the lack of the interactive skills can be largely attributed to the limitation of education that students received during the schooling time. Facing the exam-oriented education which only focus on academic performance, most of schools and institutions would prefer to put emphasis on imparting academic knowledge to students rather than cultivating students in an all-round way. Therefore, for those only tutored through the spoon-feeding approach, by which I mean students acquire through rote memorization, it is extremely difficult for them to cooperative with their colleagues without any previous experience. Besides, the psychological obstacles caused by the violate competition might be another culprit that gives rise to this phenomenon. With exploding population in the modern society, people are suffering from mounting pressure of work and study. In other words, facing the peer competition, during the school time most of students are forced to learn independently, while after graduation those new graduates would still prefer to work alone so as to prevent the products of labor from being stolen. Under such this psychological barriers, even if forced to join the team cooperation, it is difficult for people to play their due level.

Several feasible methods can be adopted in the hope of alleviating the situation. First of all, the educational authorities should supervise and guide the schools and universities to diversify the teaching approaches and meanwhile offer the extra curriculum activities in order to meet the need of well-rounded development. For example, apart from the writing assignments and memorization, teachers can organize students to carry out project researches and require students to cooperate to complete. Second, the company's evaluation criteria for team cooperation can be further refined to give each participant an objective score and reward so that the enthusiasm of participation can be enhanced.

To summarize, in order to deal with the lack of interpersonal skills of new employees, diversify the teaching approach as well as refining the evaluating standard of every employees are the two solutions that I came up with.

公众号：雅思情报圈

混合类 限制工作时间的法律

Some countries have introduced a law to limit working hours for employees. How this law can be introduced? Do you think it is a positive or a negative development?

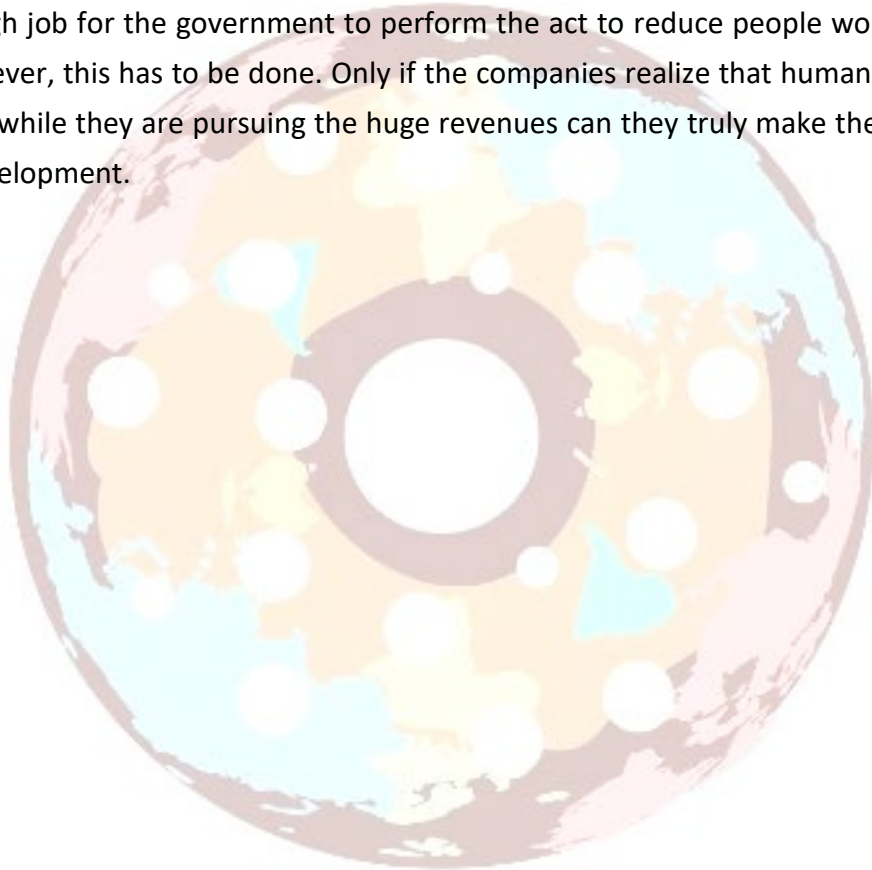

I would believe that the laws set for limiting working time in many societies are what the government uses in response to the current trend, and that is certainly a good thing for the future economic development.

The laws introduced may be a reaction to the growing trend towards people working overtime in many companies. This trend results from the fast-growing industries in modern society and the fierce competition between companies in a market-based economy. Industrialization increases manufacturing speed, bringing about larger supplies and lower prices; such improvement in the production renews moment-to-moment the equilibrium of the supply-and-demand system. The more affordable prices and an abundance of market supply satisfy people's needs but escalate the competition between companies and industries. Shareholders want their goods or services to account for a larger share and to keep the increase of the annual revenues. As a result, they may urge their managers to work harder and force employees to work non-stop to meet the requirements for ever-growing productions and more innovations, thus outperforming the rivals in the market. Ultimately, to work overtime then becomes mandatory in many companies, as unwritten law, and based on a rule of thumb, in industries such as IT, employees are required from the outset of their careers that they may have to work for at least 10-12 hours per day, six days a week. When the situation has become worse and the occasional death reports due to working overload have angered the public, the government stands out to intervene the economic system; laws are then set for protecting the vulnerable group (in this case, employees) from being forced to work overtime.

Like most things, I believe that the laws concerning this are necessary, and the results would be promising. Although too much intervention is highly vetoed by many economists, like Adam Smith, who suggests that the balance among companies should be totally market-driven, the government's role in today's economic systems is rather significant. Laws set for limiting the working hours may efficiently order the companies to develop at a regular pace and make employees aware of their rights to reject the unfairness in their jobs. Entrepreneurs tend to develop their companies in their own interest, and they would also chase endless profits by ignoring human rights and fairness. However, when forcing staff to work overtime becomes illegal, bosses may have to give leisure time back to their employees and slow down their paces for a regular speed increase. The market would be at equilibrium again because of this since working time is no longer the factor that determines production; should a company want to outperform others, it would care about other things like

innovation or cost-cutting instead of squeezing its workers. Besides, the regulation also favors employees, who would be otherwise desperate because of their stressful working life. Without a law setting, a job seeker may have nowhere to go if S/he doesn't want to have a job that occupies, say, 90% of their life, because those companies that require no working overload are either low-paid, or too competitive for most people to have. However, the dilemma would then be easily overcome if there were time-squeezing "sweatshops" existing, and workers would have more choices about the working place that won't plague their rights and interests.

It is truly a tough job for the government to perform the act to reduce people working overload in their jobs; however, this has to be done. Only if the companies realize that humanity should be the one underlying while they are pursuing the huge revenues can they truly make the sustainable and responsible development.

观点类 企业至少 4 周年假可以更有利于员工的工作

Employers should give their staff at least a 4- week holiday a year to make employees better at their jobs. To what extent do you agree or disagree?

范文:

While there has long been a controversy whether businesses should provide annual leave up to 4 weeks to their staff, I tend to say that we should pay more attention to the side effects of this practice.

Superficially, a prolonged vacation will be undoubtedly applauded by employees, though the intended benefits to work remain dubious to me. Living in the modern society with high stress, many working adults are toiling around the clock dealing with endless tasks, which might eventually exhaust their enthusiasm towards work. In response to this, a longer holiday seems to be a practical policy, which not just allows them an opportunity of recharging physically, but increases their job satisfaction.

However, beyond the seemingly advantages, comes my apprehension about the negative ramifications of this approach. The first problem we cannot afford to ignore is the impact on the productivity and efficiency of the corporation. The modern enterprises are moving in a direction where there are seldom any positions duplicated, meaning that the absence of any staff for a month or even longer will lead to the disruption of the work process of a company. Such a result is hard to swallow for any employers.

Another factor neglected by the advocates of extended holiday is that it might jeopardize the relationship among colleagues. To watch others putting their feet up for long might spark the jealousy mood within those who are still locked in front of computers. In the other way around, if one's tasks were to be covered by other team members in the office, it would exacerbate the already heavy workloads of other colleagues.

Given this, I would reiterate that an extended holiday of staff should not be to the detriment of the development of company and the team spirit.

范文 2:

I would argue in this essay how simple-minded the opinion is to attribute the job performance to the paid holiday and about the irrationality of the time limit of the holidays.

There is no clear correlation between whether or not the employees are permitted to have paid holidays per year and how well they perform in their jobs. Before assessing what contributes to the

level of working achievement, one should first introduce a relatively holistic system to have a rational consideration. Factors are lying behind the final job output: welfare system, payment, proper incentive mechanism, and more importantly, the staff's competence in doing their jobs. A paid holiday may play a part in making employees, to some extent, satisfied with their current working environment. However, it is certainly not the dominant part that ultimately decides whether the employees would do well in their jobs. All the factors listed above should be meticulously balanced to promote the performance, and there is certainly no single management that can be exploited by employers to achieve such a complicated goal.

Even if there should be a paid holiday for most employees as their benefits or non-material rewards, the time length should not compulsorily be over four-weeks. The myopic thinking exhibited in the topic fails to establish the criteria based on the concrete situations of different companies. How long an employee could enjoy the holiday depends on parameters like, say, what type of job one is involved in, the working load of it, the potential output or revenues one may produce, or sometimes, the actual value of the employee reflected in the eyes of a boss. The days permitted also vary from company to company, or among industries since not all types of jobs would allow the related practitioners to leave for such a long time. It would then be too subjective to rule the holiday policy that imprudently without thinking about reality, and even if there is a fixed regulation concerning the time limits, the credibility endured is relatively frail.

In conclusion, it is the unreasonable causality given in the topic that makes me question whether paid holidays are the dominant cause leading to working performance. I certainly believe that it is arbitrary for all companies to give employees at least four-week holiday.

公众号：雅思情报圈

观点类 企业应该有社会责任感

As well as making money, businesses should have other social responsibilities. Do you agree or disagree?

范文:

It is reasonable for the company to place money-making on the top of their list, but it is also necessary for them to have some social responsibilities. These are both indispensable factors for every company.

Making money seems to be one of the most straightforward targets for entrepreneurs to set up their business; this is the rudimental reason why they have started this: to earn money is the only way a company takes to survive. The costs force every company leader to devote to produce revenues from the outset of any establishment, during which bosses need to pay for the projects they launched, the workplace, the quota for their actions, taxes, the salaries for employees, and further investment for their development. If there were no enough money to sustain the expenditure in the above aspects, the companies should face difficulties such as the loss of employees or no place to work due to insufficient incomes to pay for staff. Hence the companies have to figure out all measurements to meet the demands of their customers to produce profits for their sustainable development.

In my opinion, all businesses must have social responsibilities, since this is the ethic framework planted inside a company, and in most cases, fulfilling the demands for the positive development of the society can also bring about benefits to the business at large. Apart from maximizing the shareholder value, companies should also obey the basic rules: not doing evil like killing the wildlife, or at least not blighting the environment that much for the company's interests. At the same time, companies should also involve in social activities like, say, protecting wild animals or purify the polluted water to better the ecosystem. These can earn a reputation from the public and can build up an excellent image, which would be significant for their further paces, or for attracting some extra investment.

In conclusion, I would very much agree with the opinion that a business is hard-wired to rank profit-making at the top. Yet it is also necessary for those companies to take proper social responsibilities.

利弊类 企业从大城市迁移到地方是否利大于弊

Governments are encouraging industries and businesses to move from large cities to regional areas. Do the advantages outweigh disadvantages?

范文:

Urbanization has taken place around the world in the past few years, symbolized by the development of both regional cities as well as large cities, especially in developing countries. Currently, governments are increasingly willing to encourage the relocation of industries and businesses, that is, moving out from big cosmopolitan cities to its regional areas, and many people start to question the cost-effectiveness of this act. Personally, I believe it is still a valuable transition that should be made in the short term as well as long term.

First of all, with the growing population as well as the increasing intensity of buildings in large cities, industries and businesses, especially for manufactures, is not only high-cost but also unnecessary to stay in large cities. Compared with the high rent that industries and businesses needed to afford in big cities, moving to regional regions will not only alleviate the huge financial burden but also can ensure the quality of the service since it no long takes much time to deliver goods to consumers with the advances of logistics. Therefore, it is a more cost-effective choice to industries and businesses.

Moreover, the entering of more industries and businesses can also help develop the regional areas so that regional disparities can be improved. With the rise in the number of the companies, not only will the economy of the city be boosted but also the well-being of people there can be enhanced, which also can be regarded as a determining step of the regional developments.

Admittedly, there are many risks that those industries and businesses will have to face, especially when it comes to localization which is one of the reasons that cause the insolvent of various companies. However, with solid research, sufficient precautions and attention on the possible setbacks during localization, it will not be a fierce problem to tackle, let alone considering the high cost-effectiveness for both companies themselves as well as those regional cities.

Above all, I believe, the merits overshadow the demerits.

利弊类 商务培训和会议在网上举办的利弊

Nowadays more and more business trainings and meetings are taking place online. Do the advantages outweigh the disadvantages?

范文:

It has become an impending trend that a growing number of business trainings and seminars are hold online. While some people might worry about the negative effects of the tendency, looks to me that the benefits are far outweighing.

The main drawback of the trend towards online business activities is that there is less direct interaction. Audiences may not have the opportunity to engage face-to-face with the trainers or speakers, and will instead have to rely on written forms of communication. Nevertheless, the new video conferencing function allows for synchronous communication among all participants. Also, another most frequently mentioned limitation is the hardware. There are some trainings requiring professional equipment or locations that are not available in the Internet platform – some regard it absurd to watch a bakery training via the screen with hands in the pocket doing nothing. Fortunately, this apprehension can be mitigated with the emerging VR (Virtual Reality) technology, which recreates the real-life environment by computer.

Despite the negatives mentioned above, I believe that online business courses are a positive development for various reasons. One obvious merit is that it allows more people to participate. Whereas the traditional lectures are only available for local residents, the Internet makes it possible for people at every corner of the world to engage in any events in a virtual world – an individual in Shanghai now can take part in a live seminar held in New York and communicate with other learners the world over. Another key attraction for organizers' preference for online events is that they are far more cost effective, meaning that a host of expenditure are saved, from renting and decorating meeting rooms to servicing food and drinks. Even the authority is encouraging the modern trend, as it is more environmentally friendly than its traditional counterpart. It is not difficult to count how many air flights would be involved in an traditional international summit meeting.

In conclusion, while I recognize the possible disadvantages of online business sessions, I consider it to be a positive trend overall.

利弊类 网络普遍使人可以在家工作学习

In most countries, with the widespread of the use of Internet, people have more freedom to choose to work and study at home instead of travelling to work or college. Do advantages outweigh disadvantages?

范文:

The spread of newer technologies such as Wi-Fi and Cloud software systems has allowed studying and working from home more accessible. Although being in a comfortable setting has its advantages, the disadvantages are more outweighing especially in terms of efficiency and productivity.

It is argued that home study and home-based work are more productive as there are no to less disturbances in the form of classroom or workplace buzz, which is supposed to allow for more concentration on study and work. However, the truth is rather the opposite. Procrastination is often common among home-based students and professionals, since individual learning and working requires some constancy, discipline and responsibility. The lack of supervision or simply being at home for so long makes it possible to increase the temptation of lying in bed, surfing social networks or taking a nap, which will inevitably result in slow progress and poor performance.

Besides, isolation and loneliness are constantly felt and complained by people who study or work at home, unlike school and workplace which provides a location where people can meet people, make friends and exchange ideas. Consequently, the less they get involved with others, the less creative and resourceful they will become. Worse still, the result of home study and home-based work leaves too much to be desired, as students who received education at home do not have teacher around to provide guidance or answer questions when they encounter difficulties and employees who work from home are unable to contact their colleagues for assistance and help.

In conclusion, there is a knock on effect of study and work due to the absence from school and workplace and the lack of physical contact with fellow members, especially when currently many educational institutions and organizations are yet to evolve a coherent and cohesive arrangement and policy for learning and work from home.

利弊类 电脑技术使人可以在家工作

With computer technology becoming cheaper and more accessible, more adults work from home and children study from home. Do you think it is a positive or negative development? (2011/03/19)

范文:

It is true that the development of computer science and technology has made it possible for employees to work home-based and for students to attend online courses at home. While there are certainly some drawbacks to working and studying at home, I personally would argue that this is a positive trend overall.

On the one hand, it is undeniable that working from home can cause inconvenience in a variety of different ways. The main difficulty might be the distractions people are likely to face when trying to get things done at home. For example, having a conference call with your toddler crying out aloud in the background or your cat elegantly walking on the keyboard of your laptop would be a total nightmare. Even if you do not have kids or pets, it would be just as hard to fight the urge to watch some YouTube videos or check out Instagram for your friends' new posts. To make it worse, working or studying from home makes it extremely difficult to supervise workers and students, which can result in low efficiency for all parties.

On the other hand, not having to go out for work or study can bring a lot of benefits to both workers and students. Firstly, a massive amount of time spent on getting ready for going out and commuting can be saved if people can stay at home instead. Secondly, not having to show up at the office or school allows much more freedom in people's choices of residential locations. For example, a couple who work far from each other will be able to live together without anyone having to make the sacrifice of traveling long distances to go to work; and someone who attends a university downtown where the rent is incredibly high can save money by living in the suburban area with the inconvenience of commuting erased. Thirdly, people can make themselves as comfortable as possible when working from home, which is a privilege they do not have in the usual workplace or on campus.

In conclusion, it is my opinion that the advantages of working and studying at home outweigh the disadvantages.

观点类 在家办公对谁有利

Recently some people can work from home using modern technology. Some say this only benefits the workers, but not the employers. To what extent do you agree or disagree?

范文：

Over past decades, there has been hesitance from employers of letting their team to work remotely at home. However, the spread of newer technologies such as Wi-Fi and Cloud software systems nowadays, which allows efficient operation and effective supervision, enable both employees and employers get to reap benefits.

Apart from an improved employee well-being, employers benefits just as greatly from home-based employees, who are found to be more productive than their in-office counterparts. Those employees are prone to work longer hours, take less breaks and use less sick leave. Also there are no to less stress and disturbances in the form of workplace buzz as well as less office politics and inefficient meeting, which is supposed to facilitate more concentration on work. All of these are proven to be helpful for overall performance, motivation and creativity of employees and ultimately benefits the company.

Besides, the accessibility of remote work opens the talent pool for employers by enabling employers to embrace diversity and inclusion by hiring people from different geographical locations and cultural backgrounds as the recruitment is no longer restricted to certain area that not everyone wants or can afford to live near. Meanwhile, it is obvious that working from home is economical for employers. There is less of a cost on office space. Less furniture and other utilities are needed and less electricity is used.

In conclusion, employees are not the only ones who benefit from the practice of working from home. In fact, it is a win-win situation for both parties, especially when newer technologies offer a way out for some potential concerns and a more coherent and cohesive policy is devised.

国际类

双边类 对社区直接援助 vs 赞助慈善组织

Some people prefer to provide help and support directly to those in the local community who need it. Others, however, prefer to give money to national and international charitable organizations. Discuss both views and give your opinion.

范文:

While some people prioritize the problems in their own communities when it comes to the issue of charity, others believe that anyone in need are entitled to financial support regardless of the geographic boundaries. To me, both views are just different emphases of the question; each view has its justification under different circumstances.

From the perspective of people in impoverished areas, it does make sense that they opt to focus on local communities. To them, their own lives have been plagued by a myriad of problems, whether these be poverty, unemployment, crime rates, or underdevelopment of public services like medical care and education, all of which have frustrated lives of local residents and exhausted the already frayed budget of local government. I doubt they have any extra money or effort to help people outside their horizons. Even the advocates of cross-regional cooperation have to compromise with the hardship in reality.

However, this principle that works with less developed regions does not translate automatically to other places where individuals enjoy higher quality of life and are faced with less societal problems. To them, the optimal model of charity is at the national or even global level, whereby the money can definitely go to the most needy people, particularly those suffering calamity of famine, fatigue or wars. Meanwhile, many multi-national charitable organizations, with their branches at every corner of the world and accrued experience, make it possible for national and global charity. To take the flood in New Orleans for example, the donations from other states of America and the rest of the world was sent to the victims within 24 hours through the network of the Red Cross and other non-governmental organizations (NGOs).

In my opinion, whether charity should be local based or cross-regional is not an either-or issue. Instead, it is a complicated problem that requires the combination of the both practices in terms of different contexts.

双边类 是否应该有国际援助

Some people argue that countries should have a moral obligation to help each other; on the other hand, some people argue that a large amount of aid money does not reach the poor of the world. Discuss both views and give your own opinion.

范文:

People have different views about whether countries in the world should have moral responsibilities of international aid. In my views, it is morally correct to have a sense of helping the poor, and we should find ways to use aid money more effectively.

On the one hand, countries are supposed to help other nations in need under ethical considerations. All human beings have dignity deserving respect and are entitled to what is necessary to live in dignity, including a right to the goods necessary to satisfy one's basic needs. This right to satisfy basic needs takes precedence over the rights of others to accumulate wealth and property. When people are without the resources needed to survive, those with surplus resources are obligated to come to their aid. And also, it is clear that suffering and death from starvation are harms. It is also clear that minor financial sacrifices on the part of people of rich nations can prevent massive amounts of suffering and death from starvation. It can therefore be concluded that rich nations have a moral obligation to aid poor nations.

On the other hand, I believe that foreign aid should be used more wisely. The current aid money to poor areas is often misplaced. Instead being spent on poor money, the aid money often ended up to authority corruption and military expenses, and thus it is essential to apply foreign aid more appropriately. Firstly, aid should be lay emphasis on science and technology aiming to improve people's living standard. International aids from developed countries have helped people in some underdeveloped countries like Africa, Latin America and Asia, and improved their living environment and helped them with the development of agriculture, industry and economy. Secondly, aid should also contribute to the field of education. Granting everyone a chance to approach knowledge can create well-educated workforce, and ensure the people shake off poverty.

In conclusion, world's nations should provide aid to those countries in need, and they also need to consider more effective approaches when offering aid.

双边类 援助是否不分地区？

Some people believe that the charity organizations should give aid to those in greatest need, wherever they live. Some people believe that the charity organizations would better concentrate on helping people who live in own country instead. Discuss both views and give your opinion.

范文：

Regarding the charity aid, views are mixed upon who they were there to help, those most in need or those of their own countries? The aim of charity, I think, is to alleviate the sufferings of any place where it is necessary, regardless of frontiers. After all, human misery knows no borders, and nor should charity.

First of all, the human society now is an intimate community that all of us can feel part of, in whose future we all have a stake. Plague, plunder and pollution know no borders. The devastation of natural hazards, terrorism and the hunger of children are the foes of every nation. Those intense confinement conditions result in animal illnesses that inflict on all of us. For example, without an effective control, avian flu in one area may spread to every corner of the world overnight. No one is immune to the cross-border crisis, not even the most developed countries. We have become an integral whole with a common destiny. As a matter of fact, we stand together in weal or woe, as we have shared interests and a shared future. Hence, we should provide aid within capacity to any country needing help.

Also, cross-border aiding is a good way to build mutual trust and to usher in a vibrant new world. A case in point is the deep friendship between China and East Timor, a friendly neighbor of China. China took the lead in its assistance to East Timor in its independence process, including building their first high-speed highway. And during its food crisis, China had offered eight thousand tonnes of rice for free. The East Timor people have always treasured the relationship, in the Wenchuan earthquake, they pulled all the resources together for a national donation. Although they were poor, they still raised five hundred thousand dollars. For such a small country, that is not just a drop in the bucket. On top of it, it's really good, just to know about tsunamis, mudslide or any natural disaster in case we are in one. Already, we have accumulated a wealth of experience of relief and can generalize some replicable experiences to benefit our own people.

Opponents may cast doubt on the cross-border charity. It is understandable, after all, lots of people in our own country still suffer. However, both do not necessarily conflict with each other. Overcoming all these in our own country is not something that happens overnight, which needs a long-term plan. Besides, we do that all the time, such as free breakfast in the poverty-stricken areas.

In conclusion, in face of common threats and challenges, no country can manage alone or stand aloof.
Charity begins at home, but should not end there.

公众号：雅思情报圈

观点类 世界上多数问题源自人口过剩

Most of world's problems are caused by over-population. To what extent do you agree or disagree?

范文:

Some people may argue that the surplus of population is the causation of most problems the world over. While it may be the case in some countries, I would say that over-population should not be culpable for all the difficulties we have, while some underlying reasons need to be explored.

On the one hand, it is understandable why many people see the population growth as the answer to many problems. In metropolitan cities, tons of waste, whether these be packages of products, plastic bags, defective or outdated electronic gadgets, result in the enormous pollution to the environment, as most of which are non-biodegradable and will stay in the landfills for hundreds of years to come. Another problem that irritates every urban inhabitant is the traffic congestion, which is an inevitable problem that can be attributed to the high density of population.

On the other hand, the increasing population should not be reckoned as the only culprit for all problems, while there may be other fundamental factors. One issue we should not forget is that in many countries, what the government faces is the insufficient workforce due to lower population. Canada, for example, is one of those countries that are frustrated with the lack of residents. Even in those so-called over-populated countries, if we move attention from those crowded urban cities to rural areas, the striking fact is the spare farmland due to the loss of labor force, given that the youth all move to cities in search of better opportunities in education, work and medical care. In other words, what is behind the population increase is its distribution, which is usually the result of imbalance of development and resources between the urban and the rural area.

In conclusion, although the population growth does contribute to many problems in cities, I would say that the essence of the problem is how governments institute policy to allocate the resources to facilitate the reasonable distribution of population.

双边类 名人能提高国际援助的关注度？

Some people believe famous people's support towards international aid organizations draws attention to problems, while others think celebrities make the problems less important. Discuss both views and give your opinion.

范文：

There are wildly differing views on the issue of whether the celebrity endorsement for international aid agencies should be encouraged. Some argue that this practice can effectively raise public awareness towards certain problems on a national or even global scale, while a counter-argument is that the participation of celebrities would only diminish the importance of these issues.

On the one hand, it goes without saying that the publicity of a problem can be increased by the involvement of famous people thanks to their popularity and influence. Followed by a huge number of fans, celebrities like globally well-known actors, singers and sports stars are usually the focus of mass media, and even any words they post on social media or any speech they deliver in public places will gain the instant and extensive exposure. Accordingly, their efforts made for charity are able to encourage more people to engage in charity activities. A typical example is the Ice Bucket Challenge which was initiated in 2004. The wide participation of celebrities in this campaign has brought the rare disease, ALS, to the public.

On the other hand, it is also conceivable to doubt the positive effects of celebrity's involvement on addressing the problems. While watching those super stars involving charities on screen, their followers may merely care about how their idols perform rather than the problem or message idols try to solve or convey. What's more, although the charity activities may gain higher publicity among the common citizens, few people take any action to participate in afterwards. From their perspective, the responsibility to help the needy should be shouldered by the rich celebrities, for these stars enjoy the benefits in the high-income industry and lead an extravagant lifestyle.

In my view, by using the power of influence from celebrities, international aid organizations can definitely attract public concern to the issues they are dealing with and more people will be encouraged to offer their help to the needy. However, the focus may also be diverted by the celebrities' engagement. Therefore, in order to make their participation more productive, celebrities should take the charity campaign in a more serious manner and make their contribution practically.

观点类 紧急问题只能国际合作解决？

Many of today's urgent problems can only be solved by international cooperation. To what extent do you agree or disagree?

范文 1:

Recent decades have witnessed that many crisis which reached the International level have been addressed strategically with global cooperation, so some people thus may contend that only through cooperation of different countries can these issues be effectively solved. Personally, I partially disagree with this idea.

First of all, overly dependence on the global cooperation to solve all problems may lead to delay and indifference, by which I mean, if a country can solve the problem in time, this can alleviate the global crisis to a certain extent. For example, facing the initial large-scale outbreak of coronavirus in China, the Chinese government immediately developed its own treatment to fight the virus, and following the government's guidance, Chinese individuals also wore masks and isolated themselves at home, which greatly slowed down the spread of the virus around the world. Meanwhile, this provided sufficient experience and resources for later treatment and precautions of the virus in other countries. Conversely, if China only waits for the cooperation and help of other countries when the virus breaks out, being one of the most densely-populated country in the world, I cannot imagine the disaster this would cause

Ideally, when there were a global crisis, effective international cooperation and mutual assistance would make it easier to solve the crisis. For example, in 2014, when the Ebola virus crisis broke out in Africa, many countries participated in the fight, greatly controlling the number of deaths caused by the spread of the virus. However, when the crisis first breaks out in one country or there are interest disputes among countries in international cooperation, it will be more effective for a single country to focus on solving its own problems initially.

In conclusion, despite the context of globalization, all countries have become independent on each other and many of issues, especially urgent ones, require the domestic resolution and action first rather than only wait for the cooperation.

范文 2:

In 2020, disasters occur frequently all over the world, and some global crisis, such as the spread of coronavirus, are still threatening people's life safety and social stability. Some people, therefore,

argue that the only way to solve these urgent issues is through international cooperation, which in my view is not reasonable.

First of all, the scope of the emergency problem is not clearly quantified in the title, so it is questionable whether it is necessary to rely on international cooperation to solve it. In other words, enormous crisis that need to be settled are confined to a single city, so timely rescue and financial assistance from the local government is the best way to deal with this problem. For example, when Wenchuan earthquake occurred in China, the Chinese government promptly organized personnel to carry out rescue and saved numerous lives in time. Otherwise, if we simply wait for the assistance from all over the world, the consequences are unimaginable.

Moreover, other subjects, such as individuals and enterprises, can also play a crucial role in solving the urgent crisis in today's society. With the social and technological advances in the modern world, individuals, especially celebrities from all over the world, can guide the public to enhance the public awareness through the social media and network; companies, as the main body of science and technology research and development, also play a decisive role in the final solution of many emergencies. For example, at the beginning of this year's coronavirus epidemic, many celebrities in China work as the role models in wearing masks in public places, and various medical apparatus and instruments companies are producing masks and protective clothing at full capacity to meet the surging demand of hospitals and the public. With the joint efforts of both sides, China, which obtain the most populous country in the world, has been able to control the spread of the virus in a relatively short period of time.

It is worth recognizing that some global issues, such as global warming, really requires the cooperation and consultation among countries. Otherwise, even if some countries reduce their emissions, the problem will still not be solved as other countries since other countries will ignore or violate international treaties. However, as I mentioned just now, the premise of international cooperation is the response and participation of governments and their people. Therefore, international cooperation is not the only way to solve the urgent problems in today's world.

In my opinion, international cooperation is not the exclusive way to solve emergencies because of its lag and the existence of other subjects. It is hoped that the disaster in 2020 will be over soon.

混合类 社会受益于国际旅游和国际商业带来的亲密关系

During the 20th century, contacts between different parts of the world developed quickly, thanks to air travel and telecommunication. To what extent do you think societies benefit from increased contact and closer relationship brought about by international tourism and business?

范文:

With the social and technological advances, especially the advent of air freight and telecommunications, people's life has revolutionized. As a result, international tourism and international business has entailed people's attention due to the closer distance between people and the increase of communication. In my opinion, society has benefited from this.

On the one hand, International tourism can give the society a new impetus to economic development. For example, the tourism industry, which is New Zealand's largest export earner, contributes significantly to New Zealand's economic growth and prosperity, contributing approximately 20% of the total exports for the year of 2017, according to BBC's report. Besides, total tourism expenditure in New Zealand also continues to increase, along with an increase in international tourist arrivals to 3.5 million visitors. This increase in visitor spend provides strong economic opportunities across the tourism sector and related industries.

On the other hand, international business also has many advantages and benefits for the society, especially the one related to production or manufacturing company. A major advantage the company can have is that the product it produces is not available in the international market which the company is targeting. The firm, therefore, has a "production advantage" which it can use to maximum benefit. As a result, it is one of the benefits of the International business that the firm can establish a monopoly or a duopoly in the target market, thereby generating a lot of revenue. In other words, if the products are differentiated and the differentiation is possible only in one's own country, then a company can definitely benefit from expanding the International markets.

Overall, there are many benefits to international tourism and international business expansion and all the above points prove that if one country has the capital and the potential to expand, then one should do so because there are many benefits associated with it.

观点类 跨国公司对所有有利

Some people think the spread of multinational companies and globalisation produce positive efforts to everyone. Do you agree or disagree?

范文:

Not everything about transnational corporations and globalization is beneficial. Any change entails gains and losses and the situation is worse in the less developed world.

Admittedly, globalization creates a more conducive environment for investors to conduct business across the world. Under such circumstances, many enterprises invest their capital and locate their manufacturing units in developing countries, where the ratio of capital to labor is low. The jobs multinational companies created in those countries by employing vast numbers of local population are a result of outsourcing labor from their parent countries, which damages economy and increase the unemployment rate in their parent countries.

For less developed countries, when multinational corporations enter the domestic market, local companies will inevitably face huge threat. With their vast resources and competitive strength, those transnational enterprises can easily take over control of the market and weed out their competing counterparts, especially small and medium enterprises. Worse still, in the case of profit repatriation, it is noteworthy that many enterprises will not reinvest profits back into the host country, resulting in large capital outflows from the host country.

Furthermore, in a world where facilitates expanding business operations on a worldwide level, governments especially those at economic disadvantage, grant incentives, ease labor standards or even pass environmental regulations that favor profits over nature in order to attract or retain capitals. This inclination is prone to result in a major destruction of human rights principles and the damages done to the environment can hardly be reversed.

In conclusion, the spread of globalization and multinational enterprises does not necessarily benefit everyone. There are aggregate gains, but also distributional concerns. However, they should not be avoided for fear of their adverse impact. Instead, more cautious actions should be adopted when we are confronted with this inexorable trend.

利弊类 人们在偏远地区和无人区找能源是否利大于弊

With the increasing demand for energy sources of oil and gas, people should look for sources of oil and gas in remote and untouched places. Do the advantages outweigh disadvantages?

范文:

Human beings have excavated and exhausted much of the planet's fossil fuels and natural gases. By the turn of the century, the pressure of running out of energy resources have consequently forced people to seek such resources in remote or untouched regions. In this short essay, I shall argue that although by doing so will have limited benefits, inevitably more issues will arise.

Admittedly, the majority of moving vehicles and heating household system are still running on oils and gases. The overall demand for such resource is still increasing exponentially on a day-to-day basis. Therefore, energy companies must find a solution to resolve this colossal demand. Hence, by searching and drilling for fossil fuels in more remote or even uncivilized areas, people can gain access to a much greater amount of energy resource, for instance, by drilling deposit of resources compared to the land. In addition, by moving excavations and driller site away from the inhabitable regions, people can limit the amount of harmful pollution released directly to civilization.

However, the reality of such actions often carries numerous negative consequences. First of all, searching energy in remote areas will simply increase the amount of energy required for transportation. Often referred as carbon emission, this will give rise to even greater energy demand and is an extremely unsustainable way of development. Notwithstanding, the action such as drilling into the ocean floor may lead to catastrophic damages to the oceanic ecosystem. There have already been numerous accounts of oil and gas leakage from deep ocean platforms. The recent one occurring in the Mexican Bay has resulted in disastrous impact on the local faunas. Furthermore, there are still unpredictable consequences that may cause damaging impacts on the already degrading climate and planet conditions.

As conclusion, the method of searching fossil energy in remote areas is venerable yet unsustainable development. Human beings should make great efforts to seek for renewable energy sources.

观点类 科学家和游客都可以去偏远的自然环境

Nowadays both scientists and tourists can go to remote natural environments such as the South Pole. Do you think the advantages of this development outweigh the disadvantages?

范文:

As the modern science and transportation tool progress simultaneously, both scientists and tourists are granted access to remote places. Although there have been criticisms on issues that are not to be neglected, I still hold the view that the benefits of such phenomenon outweigh the drawbacks.

Firstly, despite some human activities that bring negative influences on the local eco-system, exploring remote places equals possibilities to delve into what we human already have and make more of it. For instance, the South Pole contains enormous amount of water and provides ideal geographical position where scientists are able to observe the atmosphere closely. In this way, not only can we obtain more comprehensive information of our resources, but we would also become more capable of finding out other measures to protect the whole planet.

Furthermore, visiting isolated areas may to some extent boost cultural communication. People living in the South Pole, deserts or small islands definitely lead different lives compared to most human beings who live in the fast-paced modern society. At the same time, what is hidden behind the lifestyles can be various attitudes towards life. With the bloom of homestay hotels like Airbnb, tourists are allowed to immerse in completely novel surroundings, experience the local habits and even have memorable chats with their hosts. As a result, such communication among people of various values is very likely to contribute to the harmonious co-existence of multiple cultures.

By way of conclusion, given the overall beneficial effects, people should not be afraid of looking into the unknown fields in spite of the opposite sounds.

公众号：雅思情报圈

混合类 消费品产量提升对环境伤害原因及解决方案

An increase in production of consumer goods results in damage to the natural environment. What are the causes and possible solutions?

范文:

Mass consumption in the wealthy nations as well as in other parts of the world encourages boom in production and growth in manufacturing industry. Unfortunately, this unfettered consumption is causing environment deterioration and resource deficit and solutions will be needed to curb or counteract these negative effects.

The cost to the environment is borne by the production, processing and disposal of the products. During the process of manufacturing, raw materials and energy, many of which are not renewable or regenerate, are extracted brutally from nature and produced in a very polluting way. For instance, in the elaboration process of raw materials, harmful chemical substances are introduced or fossil fuels are burned to facilitate production, especially in countries where minimum legal requirements are not always respected and toxic by-products are generated. Besides, the production growth is often based on planned obsolescence and increasing level of waste, which is a problem in itself, as those wastes are probably just dumped into the rivers and oceans and harm the ecosystem and creatures that live in the sea. Worse still, in most cases, the wastes are involved with toxic or plastic materials, which means they remain a threat for many years to come.

Although we are not able to reverse what is happening, there are still ways to alleviate this situation. One option is for companies to design products responsibly with little load on the environment and adjust the linear production system to a circular one, where obsolete products are repaired and re-used. Also government could initiate laws and regulations to press manufacturing industry to devise purification system allowing proper disposal of wastes. In order to reduce emission of extreme exhaust, policymakers could set restrictions on the use of coal, petrol and diesel, while aiming at reduce emission of extreme exhaust, while develop energy supply through the creation of nuclear power.

In conclusion, the demand for consumer goods will continue rising as it is so ingrained into the cultures of the current world, but it is never too late for us to realize those potential risks that awaits and a more sustainable production is not too much to consider.

报告类 垃圾回收不够的原因和解决办法

In some countries there are not enough recycling of waste materials (eg. Paper, glass and cans). What are the reasons and solutions?

范文:

Due to rapid growth in urbanization and industrialization, waste utilization becomes an importance aspect of the conservation of the environment. However, in some countries, the recycling of waste materials is unable to meet the expectations. It seems to me that the lack of equipment and awareness regarding to the recycle of garbage are the two main culprits.

Initially, the issue can be largely due to the lack of recycling sites and the matching equipment. After all, in some countries, the government cannot make purchases on enough recycling sites due to the deprived financial conditions. Even if other countries can afford these, the current technology has limited the reuse of the waste materials even after collecting them. The waste is either shipped to landfills or burnt in incinerators, either way leading to an unnecessarily large amount of toxic soil and water pollution that can harm the ecosystems. Besides, this problem can also be attributed to the lack of awareness of recycling, by which I mean individual recycling efforts have no real overall impact. Misinformation about overflowing landfills and depleted resources has convinced some non-recycles that the contribution to recycling can hardly make a difference, which seems to be a waste of time and causes inconveniences at the same time.

Several methods could be adopted in order to solve the aggravating problem in the hope of alleviating the situation. First, the government should strive to support and compensate the relative careers as one of the priorities. After all, in order to have the full realization of rubbish collection eventually, the advanced technology plays a crucial role, which requires enormous funds, talents and policy support. Second, sufficient education regarding this issue is also indispensable. One the one hand, the educational authorities could try to add some selective subjects to let children and teenagers absorb the knowledge directly, and meanwhile as for the general public, more non-profit advertisement should be demonstrated, not only related to the importance of recycling, but the knowledge of how to recycle of waste materials.

To summarize, in order to avoid the deterioration of the environment, allocating more financial support and adequate education are the two solutions that I came up with.

范文 2:

It is common to notice that a large amount of resources is misplaced and cannot be recycled appropriately. This essay will first analyse the possible causes of the lack of recycling and then put forward several feasible solutions to avoid the aggravation of this problem.

There are two main reasons to blame for the recycling problem. Primarily, individuals should be called to account because of the public may not aware of the importance of saving and reusing materials. The prevalence of consumerism also acts as a catalyst of this phenomenon since they tend to throw the old belongings away rather than repair them and they may use the products wastefully. Another contributing reason is the deficiency of recycling sites in both urban and rural areas. For example, many cities are not equipped with necessary facilities to support the garbage classification. Therefore, even though citizens spare extra effort to sort garbage into various categories, these useful wastes are still been disposed in the same way, which still may upset the ecosystem.

The alleviation of this problem requires the joint effort from both governments and individuals. The top priority is for governments to allocate necessary facilities to set the recycle mechanism which enables citizens to engage in this environmental-friendly activity. It is also indispensable for governments to enhance people's awareness of recycling the useful wastes. For instance, a series of lectures could be held to make the public realize that their daily activity could actually make a difference to the environment. As for individuals, they should cooperate with the government to classify the garbage into different dust bins, which could bring much convenience to the recycling process.

To sum up, the neglect of recycling and the lack of recycling facilities lead to this problem, and I believe both governments and individuals should work together to mitigate this situation.

观点类 种树还是盖房

Some people think that it is more important to plant more trees in open areas in towns and cities than providing more housing. To what extent do you agree or disagree?

范文:

It is argued that more urban land should be distributed to vegetation than houses in towns and cities. I, personally, hold the view that a balance between the greenery and houses should be kept for the city planning.

The merits of preserving more urban areas for greenery can be manifold. First and foremost, the green belt plays a crucial role in ensuring consistent supply of fresh air to all the urban inhabitants. Via the photosynthesis, most green leafy plants help convert the carbon dioxide in the atmosphere into fresh oxygen that the life of human and many other fauna relies on. Without sufficient plants grown in cities, hardly can the healthy provision of oxygen be guaranteed, let alone trees' other eco-friendly effects to the city, including filtering some detrimental gases or vehicle emission in the air, and adjusting the urban temperature and humidity, to name just a few. Moreover, the scale of green area is now considered as a critical standard to measure a city's life quality and progress made in its civilisation. The easy access to nature encourages citizens to organise more outdoor activities which not only can improve the physical well-being, but enhance the family bond as well.

On the other hand, there is no denying fact that the accommodation of continuously growing urban population is still the priority to most city councils globally. The housing issue can be the basic needs for the city dwellers, which directly determines the life quality and happiness index. In the light of this, it is conceivable that some city-planners chose to construct more high-rise blocks of flats with the sacrifice of some urban green. For them, how to meet their citizens' basic physiological and safety needs, particularly securing a shelter, is unquestionably more straightforward and realistic.

In conclusion, giving too much place of urban housing to vegetation or vice versa is an extreme measure. From my own perspective, an equilibrium between these two demands should be laid more emphasis on by the city-planners.

双边类 淡水的使用权

Some people think they have right to use as much fresh water as they want, while others believe governments should tightly control the use of fresh water as it is a limited resources. Discuss both views and give your opinion.

范文:

As population and income growth lead to increasing demands for freshwater and freshwater scarcity, changes in water governance and policy are advocated to tighten the control over fresh water use. Although I will not argue that people are entitled to use water recklessly, it is also thoughtless to simply set strict restriction on water use from the authoritative side.

Water is necessary for the sustenance of all living creatures. It is the world's most precious resource, fueling everything from the food we eat, to the cotton we wear, to the energy we depend upon every day. And freshwater habitats—such as lakes, rivers, streams, wetlands and aquifers—house an incredible proportion of the world's biodiversity. Yet despite the massive role water plays for people and nature, water is not a limitless resource, particularly the fresh potable water. Less than 1% of the world's water is fresh and accessible. Therefore, the notion that people are free to use water lavishly is both selfish and improvident. Without conservation efforts, this vital supply may be exhausted.

For another, focusing on strict water governance is too narrow an approach and would not have the desired result as domestic water use only contributes partially to the issue of water scarcity. In fact, fresh water resources show a qualitative and quantitative deterioration through time resulting from overexploitation in agricultural and industrial purposes, climatic constraints and multiplication of the diffuse sources of pollution, which are obviously beyond the realm of the approach of tightening control over water.

In conclusion, in order to ensure sustainable utilization of water, a very rigorous process of evaluation is called for, so that we can make informed decisions. It may require collaborative efforts of both individual and government in the light of decreasing freshwater availability, but conservation does not necessarily mean deprivation.

报告类 人们不理解自然界重要性的原因和了解方法

People have little understanding of the importance of the natural world, what are the reasons and how can people learn more about the natural world?

范文:

People's isolation from the wild, as well as no direct benefits generated by the nature engenders the indifference of the public to the significance of the natural world. I would suggest in this essay solutions to improve the individual awareness to natural surroundings.

Two main reasons lie behind the phenomenon of people lacking understanding of the nature. One is the distance far from the human world of the nature itself. Our livings have long been evolved into the form of communities and groups concentrating in the man-made surroundings, within which people get more used to be urbanized, or civilized without getting in touch with the wild lives, plants or every natural creature. Even those engaged in farming or herding, the just activities that are considered closest to natural world, are only involved in the so-called "agriculture" or "domestication", which are way too far away from the genuine "nature". Another is the fact that the importance brought by the natural world, granted, is not directly linked with people's daily life. Most individuals, or should I say, almost the entire human being care more about profits, especially those which could immediately contribute to their living standards, convenience or comfortability. Sadly, however, the key role of nature is always played on things like environmental manipulation, climate adjustment, or the preservation of food chain, bio-diversity or the coexist of ecology, most of which are not even close to the functions rapidly or intuitively improving our lives. Nor do people care about the nature which seems meaningless and remote to individual personalities.

Whereas solutions are adaptable for increasing people's understanding, notwithstanding the lack of knowledge of the wild ever since somewhere from the history. Firstly, eco-tourism is highly welcomed for attracting the public willing to go out of their hometown. People should be encouraged to outgo away from their familiar living environment, to the places without so many human civilizations—no dwellings manifesting the elaboration of architecture, or no scenery reflecting residential customs, or habits—to truly sense the beauty of the natural world. It is an effective way for people to better their recognition to things apart from their own without artificial technology available. Simultaneously, citizens are highly recommended to be influenced by the visual inputs from the mass media about the natural beauty and the importance of it, because it seems overwhelmingly impractical to make everyone take wild journeys, but sounds much realistic to inject this type of information via documentaries, real shows, tv programs or films. Even though this may be relatively biased due to the subjectivity from the media makers, it is also a telling scheme to increase people's understandings.

In conclusion, reasons of the departure from human's life and the seeming uselessness of the recognition to life apart from civilization may lie under people's misunderstanding to the nature, but proper solutions are likely to alter people's sensitivity of this.

观点类 个人无力改善环境，只有靠政府

Individuals can do nothing to improve the environment. Only governments and large companies can make a difference. To what extent do you agree or disagree with this opinion?

范文：

Some people assert that there is no justification for individuals in tackling environmental problems, whereas it is the business exclusive to authorities and companies. I completely disagree with this opinion as I do not see any fields that can be isolated from the general public.

From an individual perspective, there are many things they can do to reduce their contribute to environmental pollution. One option is that residents can reduce the emissions of the carbon dioxide by driving less and traveling more by public transport. The effect has been approved in many metropolitan cities like Shanghai, where convenient and affordable public transport services have played an important role in the reduction of exhaust fumes from vehicles. Another practical action that can be taken by individuals is to classify rubbish, which can make a huge difference in recycling waste.

In addition, it looks absurd to me that environmental issues are reckoned to be only addressed by politicians and business moguls. While some might argue that it is the administration that has the power to legislate against pollution, we should not forget that many bills are initiated under the influence of the public opinion. One convincing example is the decision of Brexit based on the referendum of British citizens. Also, industrial pollution should not be the only culprit to blame. One striking fact we cannot afford to ignore is the enormous amount of daily rubbish from households, such as the plastic bags and packages. How can we focus only on enterprises while turning a blind eye on household waste?

In conclusion, I do not think the problem of pollution could be addressed by authorities and large companies without the involvement of individuals.

双边类 简单生活还是靠科技解决环境问题

Developments of technology are causing environmental problems. Some people think the solution is that everyone accepts a simpler life, while others believe that technology can solve these problems. Discuss both views and give your opinion.

范文:

Technology has revolutionized the ways we live our lives. While it is clear that the application of some technologies can cause damage to the environment, I believe that technology can also offer a solution to environmental problems.

If people choose to reduce their reliance on various technologies, it can help reduce pollution. They can cut down on car usage and make an effort to avoid unnecessary journeys. For example, some people choose to go shopping by bike or on foot, giving up driving cars. It is also possible for them to spend a holiday locally, instead of travelling overseas; because of this, the demand for air travel declines. These can reduce greenhouse gas emissions.

On the other hand, some environmental problems cannot be solved without technological solutions, such as the application of renewable resources. Wind power and solar energy have been used around the world, thereby reducing the demand for fossil fuels. Electric cars and hybrid cars have also been in high demand worldwide, while conventional cars have lost the market share gradually. These technological advances can alleviate pollution.

In my view, some technologies have enabled us to enjoy modern life without increasing the environmental impact of our daily activities. By using computers and new communication technology, many people do not need to travel to work every day or drive to supermarkets; instead, they shop and work online. This can reduce carbon footprint. This is particularly important for areas whose residents suffer from traffic congestion and air pollution.

To summarise, technology is linked to some environmental problems such as air pollution in our lives, but I believe that technological advances can address environmental issues over time.

双边类 个人是否能改善环境

Some people think environmental problems are too big for individuals to solve. Others, however, think that those problems cannot be solved unless individuals take some action. Discuss both views and give your opinion.

范文:

Such are the scenarios in our highly developed daily life: the smog is smearing the sky, and the car horns are blaring all day long, whilst in the places away from humans, animals are dying, and wild fields are being laid waste. Therefore, moralists are coming out to call for possible solutions in dealing with all the environmental problems, but we, the overwhelming individuals, are still confused about what we can actually do for bettering the environment.

The controversy concerning the actual relationship between individuals and the environment may source from how we see the role of ourselves played in the nature. Right now, the Hollywood depiction of how our human is helpless, vulnerable and petty when facing the global environmental disasters has already reflected a thinking held by certain people, and that is that we could barely do anything if the environment deteriorated into an unchangeable, irreversible condition. The worst-case scenario might akin to that in the movie “the day after tomorrow”, where the whole world had gone through a brand-new Ice Age due to the global warming, during which the entire northern hemisphere had been suffering from natural disasters like hurricane and earthquake, and the mankind had been totally forcibly controlled; should the collapse happen to the protein-based, civilized world, it is obvious how the latter is powerless and how the outcome will be.

The myopic thinking exhibited in the paragraph above, as others would argue, is the rankest of all. This type of thinking doesn't allow people to make the rational causal relation between human behaviours and the environment that may be affected, and robs them of the opportunity to recognize the potential of the accumulated efforts that lies. Individuals are certainly not that useless, and it is just what every common person could do that lays the foundation of the reasoning that follows. Certain actions or personal movements may not seem like much and certainly needn't to expect a change of the problems. However, sets of related efforts and trials grouped together are what constitute insights into new discoveries, which one day may also be the cornerstone of other even more crucial breakthroughs. Actually, we humans, as the solely naturally inquisitive and rational beings in the world, seem to be the only species that could be relied on to take actions—to reasonably consume the resources, to avoid the over emission of pollutants, etc.—or the potential environment threats may otherwise increase definitely; the movie-depicting catastrophes happen someday.

In conclusion, I would very much agree that there are certainly reasons out there why individuals are not out of the cluster of the determinants of environmental problems, and we certainly need to start

playing a part in preventing the natural disasters right now, since it is the only way to make things better.

公众号：雅思情报圈

观点类 如何应对气候变化

Some people think instead of preventing climate change, we should find ways to live with it. To what extent do you agree or disagree?

范文

In recently years, despite the fact that many countries have continued investing in schemes and procedures in an attempt to curb carbon footprint, climate change still remains an increasingly pressing issue. Therefore, I believe it is time for us to accept the possibility that climate change is not preventable and to try to adapt to it.

In fact, climate change has already been set in motion and we are experiencing the effects of climate change. Temperature is getting hotter; monster storms are more frequent; diseases are on the move and wildfire and floods are happening more often, which are causing catastrophic damage and more injuries and higher death tolls. Under these circumstances, being a silent witness is no longer an option. Changing our destructive relationship with nature is important, but the major challenge right here under our nose is more of the matter about how to deal with these aftermaths and face the reality.

On the other hand, currently any program set up to prevent climate change involves cutting on carbon emission. Unfortunately, carbon-capture efforts down the road turn out to be more fantastical and slower. Because climate change is a truly global complex problem with economic, political and moral ramifications, it is almost without instance that drawing down carbon emission does not result in unbearable economic costs. Considering this, many countries are reluctant to make sacrifice, especially those focusing on economic growth.

Besides, even if we sharply reduced greenhouse gases emission, global warming would continue to happen for at least several more decades, if not centuries. There is no quick payoff as it takes time for our planet to respond and those greenhouse gases have been lingering in the atmosphere for hundreds of years.

In conclusion, since it is undeniable that the natural systems are already changing and climate change is already here and our current efforts to prevent or to postpone the process are to no avail, we are left with few options but to live with it.

双边类 人类对动植物的危害

Human activities have negative effects on plant and animal species. Some people think it is too late to do anything about this problem. Others believe that effective measures can be taken to improve this situation. Discuss both views and give our opinion.

范文:

The world at large is facing a serious threat of deteriorating land and the extinction of rare animals and plants. Aside from emotional reasons, the effort to preserve the diversity of biological life upon our planet is necessary and the survival of animals and plants is inextricably bound with the wellbeing of human, as the earth is a living ecosystem, a fragile system of interdependence and balance. Although as is claimed by many experts, reversal is impossible, still I believe that various actions can be called for to retain or halt human activities which are endangering our fellow creatures.

It is true that we are losing thousands upon thousands of species every year, with a projection of up to 50 percent of all species at risk of disappearing completely by 2050. This alarming situation is mostly due to the expansion of human populations and economic development. In most cases such as pollutants and debris discarded into rivers, canals and oceans, and varying degrees of degradation and deforestation caused by the overexploitation of nature, it seems that we can hardly undo the harms already made. However, tightening restrictions on human activities, which may result in devastating impacts will definitely contribute to curb the further deterioration.

To start simple, with a little thought and a bit of effort, everyone can engage in the effort to reduce the amount of wastes especially plastic generated by carrying reusable water bottles, store food in non-disposable containers, by sustainable products and recycle whenever possible, which as is reported has already caused tens of thousands of deaths of animals and marine creatures through being trapped or entangled. Besides, we can effectively reduce the intensity of human activity on nature such as over grazing, poor farming, and strip mining to prevent the habitat for animals and plants from shrinking. Once these approaches are implemented, marked improvement is foreseeable.

In conclusion, it is never too late to carry out actions to make a change.

Besides, it is also a compelling obligation of human beings especially when we are to a large extent, held responsible for the losing of biodiversity.

范文 2:

It is true that human activities have exerted detrimental effects on plants and animals, with conflicting views on how to curb this trend. While some people regard it too late to tackle this

problem, I would agree with the argument that there are still some measures we can do to conserve the environment.

On the one hand, it is easy to understand why some people are pessimistic about the feasibility of solutions. The reasons leading to the desperation is that survival of the fittest has long been rule in the nature for centuries, meaning that it is futile to reverse the trend. The past decades have witnessed various attempts being put forward by many NGOs (non-governmental organizations) with expectation to save endangered species, the sad truth is that they do little help to change the reality on the ground. One compelling example is the death of the last white rhino in this century regardless of the enormous effort and money invested in the conservation project.

However, I support the opponents who believe that it is not time to be desperate, while there are practical measures waiting to be implemented to reverse the trend. At administrative level, the government could initiate laws to restrict the relentless exploitation of natural environment. By doing so, the habitats of a variety of flora and fauna can be preserved, which allows enough living space for wildlife to survive and breed. For individuals, people could stop buying products made from precious animals or plants, whether these be crocodile bags or artefacts made of ivory. Were it not for the demand for such products, the hunting and poaching would be mitigated to a large extent.

In my opinion, although it is too late to revive the wildlife that have already been extinct, there are still a lot we can do to save other animals and plants at risk.

公众号：雅思情报圈

观点类 保护开始灭绝的动物

Some animals have come to extinction. There is no reason of protecting them. Do you agree or disagree?

范文:

While there is a general belief that it is an irreversible process for some endangered species to extinct and therefore we should not do anything to curb the trend, I would disagree with this specious statement because the problem can be mainly ascribed to human activities and it is imperative for us to undertake immediate remedial actions.

From the perspective of the Darwinians, the extinction of some wildlife is the inevitable corollary of the law of nature – that is survival of the fittest. They believe that only the strongest species should survive the competition created by the life cycle. Those creatures who do not adapt to the evolving environment cannot escape from the fate of dying out. Therefore, Darwinian logic would assert that any attempts to constrain this impending trend would be in vain.

However, I would say it is simplistic to attribute the extinction of wildlife solely to the selection of nature – what is ignored by advocates of this premise is the human activities that underlie this issue. One factor that brings many animals to the brink of extinction is poaching; the disappearance of the southern China tiger in last century was the result of excessive hunting. Another factor we cannot afford to ignore is encroachment on natural habitat of relentless urbanization, which is culpable for the jeopardy of wildlife habitats and disrupts the interrelationship of flora and fauna. When it comes to the positive impact of a conservation approach, the past decades have witnessed some successful measures, whether these be the establishment of natural reserves, the development of reproduction technology or the implementation of environmental awareness campaigns. One convincing achievement is the preservation of the Panda, an endangered animal whose numbers have increased thanks to these approaches.

In conclusion, it is my opinion that there are there are practical measures that we can take to ensure that the life cycle of each species is maintained and the results speak for themselves.

观点类 我们是否要去拯救濒危动物

It's a natural process for animal species to become extinct (Like dinosaur and dodo). There is no reason why people should try to prevent this from happening. To what extent do you agree or disagree?

范文:

I tend to disagree with the assertion that the extinction of wildlife is an irreversible trend, and I would therefore vote to take steps to save the endangered species.

Indeed, it might make sense to the Darwinians that only the strongest species should survive the existence of competition; those who are not adapt themselves to the changing environment deserve the fate of extinction: the disappearance of dinosaurs is a prime case in this point. Nevertheless, it is simple-minded to attribute the problem solely to the law of nature - what is ignored by them is the role of human activities behind the issue. For example, it is the relentless poaching that leads to the dramatic reduction of many endangered animals. One compelling example is the dying out of the southern China tiger in last century due to the excessive hunting. Also, another factor we cannot afford to ignore is the exhaust fumes from vehicles, which is the main culprit of global warming – a potential threat to animals inhabiting the arctic pole.

While the vanishing of wildlife is inextricably associated with human beings, we should not be reluctant to take steps to deter the problem for several reasons. The primary consideration lays emphasis on the moral perspective: we do not have the right to deprive the life of other species just to meet our greed and vanity. As well as the ethical concern, another factor we should afford to ignore is that the protection of wild animals is crucial to the survival of ourselves. The disappearance of any particular species will jeopardize the ecological balance which might impact the agriculture. For example, the extinction of owls or snakes means that there will be no natural enemy for field mice, which will lead to the destruction of crops.

In conclusion, it looks to me that the extinction of endangered animals is not the result of simply natural process. Rather, it is a problem to which I see human behaviors as a main answer, and therefore we have every reason to reverse the trend.

讨论类 给予野生动物和鸟类太多关注和资源

Some people argue that too much attention and too many resources have been given to the protection of wild animals and birds. To what extent do you agree or disagree?

范文:

It is true that millions of animals suffer and die needlessly each year, as unfortunately, they are the collateral victims of disasters and human activities. In this case, many emphasis and resources are allocated in the attempts to preserve rare or dying species. However, some people have launched attacks on the expenditure on animal protection. Yet I personally believe that efforts made to protect the animal welfare is a compelling obligation of human beings especially when we are partially held responsible for the disappearing of animals and birds.

On one hand, we have to admit the fact that earth is a closed system and therefore, all of its life is interdependent relying upon each other as resources. The more biologically diverse earth is the better the chance all species will have for survival, as obviously it ensures countless kinds of foods as well as raw materials for clothing, shelter, fertilizers and medicines all of which serves as the supporting pillar of the sustainable development of human society.

On the other, apart from natural disasters, some of the most common reasons that animals are extinct are caused by humans. They experience the terrible effects of disasters that people do: injury, starvation, thirst, displacement, illness and stress. Like for example, construction forces animals of all kind to move to a different place and adapt to a place that they're not used to. Pollution and contamination is also caused by humans. Most pollutants in the air can usually be ascribed to cars, trains, factories etc. Contamination is caused by humans throwing debris into rivers, ponds, canal, beaches and even oceans. Animal test another cause we cannot neglect. These years animals are increasingly used to develop medical treatments, determine the toxicity of medications, check the safety of products destined for human use, and other biomedical, commercial, and health care uses. Therefore, we are not in the position to opt out of the responsibility of protecting those endangered species.

In conclusion, I would say that we do need to be more aware of the protection of wild animals and birds and take actions accordingly. Yet this does not necessarily mean that we should focus our resources solely on wild species. Other approach like tightening restrictions on human activities which may result in devastating impacts on both the living species and environment we share may be more effective.

范文 2:

I would argue how the utterances exhibited in the topic fail to be quantifiable and how unreasonable it is to exaggerate the extent of the focuses and aids we have given in protecting wild animals.

The expression made by the topic might be an overgeneralization. Before assessing whether we have focused or invested too much on saving wild animals, one should first provide a set of criteria to have a sense of distinction. However, the vagueness of the claim leaves us the confusion. How much attention involved in saving wild animals can be considered "too much"? The extent is certainly unquantifiable. Even if awareness has it that sometimes we are over-panic about the species extinction as it is generally a natural procedure, and animals always die out due to the lack of environmental compatibility, the attention paid could be only considered higher than a normal amount rather than "too much". Similarly, we also lack a credible measurement to work out whether human beings have involved too many resources in saving wild animals, notably the endangered ones. We are unaware of what the future would be if we didn't take steps to protect them, and to what extent such protection should be just right, thus without knowing whether what we have done would be too much to them.

Should there exist a standard for us to judge whether we are over-protecting some animals, in that case, what we are doing would still not be close to it. Generally, when one is over-protected by others, side effects emerge spontaneously; that is a universal methodology employed by our humans to evaluate the intervention given to the ecosystem. However, it is nearly impossible for us to provide any persuasive evidence to prove that the energy and efforts we have spared on wild animals have ever been counterproductive. The attention to wild species like the research centers set in the vicinity of their active zone hasn't interfered with their living. Any related resources provided to them, like the nature reserves, or the manual intervention in terms of their fertility and parenting have also proved no harm to them. The short-sighted, irresponsible saying noting that we are providing too much protection would be a total exaggeration and may preclude us from the liability that we human, as the most rational being in the world, should establish to contribute to nature.

In conclusion, it is the vagueness of the opinion that compels me to question whether we are really doing too much in animal protection, and I certainly believe that every step we have taken is within rationality.

观点类 花费时间金钱在保护野生动物还是人类本身

Some people hold that we should spend amount of time and money on the protection of wild animals. Some people argue that they should be spent on human populations. To what extent do you agree or disagree?

范文:

While there has long been a controversy whether we should make effort to save wildlife or improve the living condition of human beings, I tend to say that wild animals deserve their role to exist in the world and therefore it is our responsibility to invest in preserving the diversity and balance of the creatures in the ecological system.

Superficially, it is easy to understand why some people claim that human beings should be given higher priority over all other species in the globe. It is undeniable there do exist a host of pressing problems around us waiting to be coped with, say, underdeveloped infrastructures, traffic and housing problems in metropolises, medical services for senior population, etc., all of which need enormous state funds. In this respect, the government should not be distracted by other issues, but distribute the limited the funds on improving the living standards of human beings.

However, plausible though the assertion is, it does not mean that improving human life should be at the cost of sacrificing the ecological balance and the survival of other animals. What is ignored by those advocates of the human-centered theory is that the extinction of other animals will lead to deleterious ramifications. For example, were it not for snakes and owls, there would be no predators of mice in fields, which would lead to the pernicious destruction of corns and other plants and therefore exacerbate the rampant famine in impoverished countries. Another factor we cannot afford to ignore is the loss of diversity in species, which in the long term might trigger ripple effects on biological and nature science research.

Given this, I would reiterate that we should given equal consideration in both human life and the wildlife conservation.

双边类 动物园是否应该关闭

Some people think that zoos are cruel and all the zoos should be closed. However, others think zoos are useful to protect rare animals. Discuss both these views and give your opinion.

范文:

I would discuss in this essay about the rationality of some considering the protection provided by the zoos for rare animals; yet I would argue that zoos are also cruel and should be closed down.

Some maintain that zoos have their reasons to exist since they provide the protection of some endangered species; the necessary elements for the survival of those endangered species would largely be provided by such a place to maintain their long-lasting lifespan. There are definitely reasons leading to a kind of animal becoming “rare”: they may be largely not suitable enough for the natural environment anymore, because of the damage to their inhabiting places or some other destroyable factors from their enemies or sometimes, human beings. A shortage to their food resources, for example, together with larger predators would directly limit their existing quantity; a location with a safety net, aiming for providing both the proper living circumstances and the protection for those endangered species from being blighted by their enemies is therefore with necessity. That is why zoos are highly recommended by those so-called “eco-protectors”, who are voting this way as a immediately encouraging method to give rise to the anti-distinction of the rare animals, and they are also looking at the commercial benefits—those animals can earn the money themselves from visitors to sustain their own living.

Whereas the myopic thinking exhibited in the paragraph may lead to a misleading function of the zoos; they don't look past what kind of negative effect and cruelty such a functional area has brought to animals. Those creatures granted need human protections, but do they have to be protected by this way, in which the limitation prevails the most actions of those animals, and their living are largely exposed to their human “audiences”? Supervisions and proper controls are certainly necessary, or should I say they are truly essential for us to treat them kindly and to sustain their long-term survival, but that doesn't mean those animals are to be isolated for the natural world and other wild lives within their food chain; besides the cages set in the zoo are actually not a true “protection” for the animals, but a prevention of them from being harmful to the visitors. Conversely, it is virtually cruel for those animals to be away from the natural environment they are urging for, and for our human to domesticate them by using a fixed schedule in terms of their feeding and life style. Zoos are therefore to be shut down, for this is just a way realizing the commercial goals for some by brutally restricting the living of wild animals by using the pretext of “protection” in a decorative way.

In conclusion, though there may be superficial clues out there for the protecting function of the zoos, I share the gift of the foresight of seeing the brutality of them and advocate that they should be shut down sooner or later.

观点类 把动物作为食物或制造商品

In modern world, it is no longer necessary to use animals for food or use animal products, for instance, clothing and medicines. To what extent do you agree or disagree?

范文:

I have to admit that the advance of technology gives us the opportunity to escape the necessity in exploiting resources from other creatures in our daily life, but to deeply consider the utterance of “necessary”, there are still circumstances in which the use of animals cannot be precluded.

To some extent, the definition of “necessary” refers to “finding substitutes in replacing any products derived from animals”, and people granted are with capacities meeting their living needs without exploiting any material from living animals in their surroundings. Nutrition, for instance, like protein, vitamins, minerals, trace elements or even fat, can be gained through vegetables, fruits and medical resources manufactured by bio-medical methodologies, since technically, people’s daily intakes mainly consist of chemicals supporting their bodies, but not any types of meat directly contributing to their lives. Besides there are abundances of natural and manmade materials apart from the living creatures we can pay attention to, in processing everything ranging from things keeping our body temperature to those sustaining our physical conditions, among which some would be growing vividly from ground, while others may be extracted and crafted via experts in chemical and physical fields.

Whereas the myopic thinking exhibited in the above paragraph, though is the rankest psychology, cannot fully cover all the situations and dwellers around the whole world. To upraise the just action of “finding substitute of animals” to the standard for the entire human being is still simple-minded, as the judgement of “necessary” always should consider the extreme conditions and the demand on the other side, or should I say for the animals per se. On the one hand, those living in specific locations, like the Inuit in the polar regions, or the Tibetan in areas with higher altitudes, where there is no natural uses of plants but just cattle or preys, if without the daily support of animals, would struggle themselves with more hardships and dark scenarios by just awaiting supplies from distant places, accompanying the severe financial burden thanks to the transports and logistics, to whom the necessity to exploit animals cannot be even whittled down in short term, let alone to be fully replaced. Additionally, animals alongside our lives since the far away historic times, most of which are domesticated by human mainly for food and other utilizations, are endued the fate of being a part of our daily usage. They may, somewhat, be the problem for the entire biosystem if we stop being parts of the food chain currently, bringing calamities to the eco-world due to the over fertility of those species and blights to the plantations, leading to more catastrophic consequences. That is also the rationality of the desirability people should take the resources from animals for granted.

In conclusion, the cutting-edge technology does bring us an era in which we find ways in substituting all the animal products, but to completely implement the replacement is still impractical due to some extreme conditions and the essence of the modern eco-system.

观点类 用动物做实验是否有必要

Some people think that using animals for experimentation purpose is cruel, but other people think that is necessary for the development of science. Discuss both views and give your opinion.

范文:

Although the animal testing has been a normal procedure of researches for years, there are some people who argue that this type of experimentation is cruel. Personally, despite its brutality and inhumanity, I still believe animal testing is indispensable as it helps to advance medical and scientific knowledge.

First of all, the current technology provides no alternative method to scientists to testify some potential side-effects that may occur on human beings. Currently, the epidemic situation in China is serious, and the related drugs for coronavirus have been developed. However, no matter how urgent the situation is, these medicines have to be applied in animal experiments first, as bionics, the study involves the combination of biology and electric devices, has not been fully developed, so scientists are unable to simulate some chemical reactions happened inside humans' bodies by using immature artificial intelligence. Meanwhile, some animals can be used as experimental subjects since the similarity between animals, especially mammals and human beings is over 80% in terms of the biological structures.

Besides, doing experiments on animals not only create opportunities for the advancement of science, but also make it possible for mankind to know more about animals. Studying cells, tissues and organs of animals provides humans with wider knowledge of how to protect them, and it contributes to the development of veterinary medicine, which focuses on the health of animals and the treatment of injuries or diseases that may affect them. Therefore, it pays to trade small sacrifices for larger benefits.

Admittedly, abuse of animals for experiments is inhuman. Our human beings have no rights to physically or mentally hurt any other creatures just because we have physical dominance. However, to help scientists to cope with ethical issues that could arise in their researches, many countries produce a code of conducts to lessen the suffering of animals. Therefore, using animals can be justified if the experimenters strictly follow the ethical guidelines like only the minimum numbers of animals should be used and the use of rewards should be considered as an alternative to deprivation.

Given this, although the cruelty of using animals for experimentation target cannot be ignored, I would say animals are needed for the growth of science.

范文 2:

Over centuries humans have experimented with many different chemicals, products, and processes, with the final aim of bettering our conditions. Testing products on animals most likely dates back centuries, however, in modern society it is a controversial point. Below is an outline of circumstances when it could be considered acceptable and unacceptable.

On the one hand, advocates believe that major advances in fighting disease, viruses and illnesses would not have been made without testing products on animals. This is because it is inhumane to test the products on healthy human beings, likewise using computer modelling to predict reactions is only a recent possibility and still not as reliable as testing on animals. Therefore, without experiments on animals, breakthroughs in medicine would have been impossible, and most would agree the price paid has been worth it.

However, opponents argue that research carried out for mere cosmetic ends is undoubtedly not worth the lives of innocent animals. This is largely for two reasons, firstly a large body of research is said to have been built up previously from past experiments, and secondly there are alternatives such as dermatological testing or using natural ingredients. For example, retail chains such as Lush and The Body Shop have both made fortunes by positioning themselves as natural solutions against animal testing. Therefore, due to the end rationale for testing on animals, and the alternatives available, it is clear it is completely unjustifiable in this situation.

To conclude animal welfare can be side-stepped when the situation is threatening humans and computer alternatives are simply too premature. Nevertheless, when the research has rather fickle motives and viable alternatives do exist, in these cases the loss of animal's lives is inexcusable.

健康类

报告类 为什么人们坚持不健康的生活方式

Science tells us some activities are good for our health and there are some unhealthy activities. But millions of people still do those unhealthy activities. Why? What can we do to change this situation?

范文:

It seems that there are still a large number of people sticking to some unhealthy habits though they have known that these habits have adverse consequences. Several factors are responsible for this and some approaches can be taken to improve this situation.

It is hard for some people, especially for those who lack self-restraint, to change their life-damaging habits such as overdrinking and smoking. People in these days live under enormous pressure, possibly due to the heavy workload and the risk of losing jobs. They regard drinking and smoking as an effective way of relieving stress and finding an escape from the reality. They are unwilling to break these habits, although they are aware of the negative consequences. They believe that the enjoyment of these habits outweighs problems.

The media also have an adverse impact on our behaviour. For example, people are likely to copy the behaviour of celebrities they see on television or in magazines, including alcoholism or even drug abuse, because they regard these famous people as role models. They may choose to eat fast food, as a result of their exposure to advertisements about these foodstuffs.

Government action can improve this situation and some policies can be enforced to encourage us to modify our behaviours. Incentives can be provided to reward healthy habits, while restrictions should be imposed on some unhealthy activities. For example, some sports events can be held in communities to promote an active lifestyle. It is also likely to impose a heavy tax on alcohol, tobacco or even fatty food, so many people will consider it necessary to stay away from these habits.

In conclusion, some people find it difficult to change their lifestyles and some habits are a result of stresses of modern life. The government has a vital role to play in dealing with this problem.

报告类 现代生活使人不健康

Modern lifestyles make many people hard to lead active and health lives. What are the factors contributing to that? How to suggest the governments and other large companies to help them do more exercise?

范文:

Over decades, owing to the innovative inventions, life has changed. Certain characteristics of modern life style such as technology dependence and physical inactiveness are serious concern in problems related to our physical and psychological well being placing individuals in peril. Therefore, society need to be more aware and empowered to curb these negative effects.

Many aspects of modern lifestyle such as instant communication and ease of travelling blur the line between work and personal time and place people at a more intensive life pace. In this case, people will undergo sleep deprivation or unbalanced diet, either starving themselves all day, and then gorging themselves until bedtime or eating on the run, standing up or while driving, which prevents the body to strengthen the immune system and increases the risk of developing chronic diseases. Besides, overuse of technology especially those labor-saving appliances and gadgets as a part of routine life reduces the need for physical work and result in an increase in sedentary lifestyle and more sitting activities. From workplaces to homes people usually find themselves sitting motionless behind desks, in traffic or in front of computer screens. Worse still, doing moderate exercise is not enough to counteract the risks posed by a whole day of sitting.

Fortunately, there are some feasible practices, which could help mitigate the negative impacts of modern lifestyle. On one hand, the government could promote a society where sporting values are respected and where everyone has the chance to lead a healthy and active life by providing sports facilities close to home or making physical activity easy to combine with work or school life. On the other hand, employers could encourage walkability or cycle schemes to and from work or arrange regular outdoor team building activities which will benefit employees physical well-being as well as team morale and cohesion. They can also allocated extra funding to establish canteen or vending machines, which provide healthier options for food and drink or ensure there are enough fridges so staff can bring fresh food or packed lunches. Also employers

In conclusion, while we are adapting ourselves to a modern lifestyle, we should be fully aware of those negative consequences. If proper actions are taken, many barriers to healthy and active lifestyle can be addressed.

观点类 靠吃肉来保持健康饮食

Everybody should become a vegetarian because we do not need to eat meat to have a healthy diet. To what extent you agree or disagree?

范文:

It is claimed that everyone should be a vegetarian based on a presupposition that eating meat leads to unhealthy diet. Personally, I would say that it is over simplified to change the dietary habit of everyone without considering discrete needs of individuals.

Those clamoring for a universal vegetarian lifestyle base this assumption in the question on their interpretation of the so-called 'healthy diet'. From their view point, many health problems such as obesity, cardiovascular disease or diabetes can be attributed to meat products, which contain high level of calories and fat. To complicate matters even more, these illnesses appear to be ubiquitous in all demographics nowadays, whether these be children, the middle aged, or the elderly. In this respect, is assumed that the fundamental solution to increase public health is for everybody to stop eating meat.

From my perspective, however, it is illogical to apply a vegetarian lifestyle to every person – the problem with the statement in the topic is generalization of the relationships between health and diet while ignoring different contexts. While excessive intake of animal fat or vitamins might be the main culprit of diabetes or obesity in affluent countries, the very threat to public health in impoverished regions is malnutrition caused by insufficient food supply. One convincing example can be seen in Africa, where millions of people lose their lives due to insufficient food. At this point, it doesn't make sense to oblige those living in hunger and poor health to live only by pure plant-based food; rather, a balanced diet with the supplement of meat products is imperative to provide weaklings with needed calories and nutrients.

It is my conclusion therefore, the appropriateness of promoting vegetarian lifestyle should not be universal but contextualized.

观点类 减少环境污染和住房问题以避免疾病

Some people say that to prevent illness and diseases, governments should focus more on reducing environmental pollution and housing problems. To what extent do you agree or disagree?

范文:

The public health always arouses governments' great concern, and many governments allocate huge amount of funds to guarantee their citizens' wellbeing. However, who should bear this responsibility has always been a controversial topic. In my opinion, individuals should take more responsibility for their health other than governments' increasing attention.

It is true that several measures could be taken by governments to prevent the diseases to some degree. Firstly, severe environmental pollution poses a threat to the public's health. If the citizens are living in an environment where the air and the contaminants are detrimental to themselves, it is likely that they will in the danger of losing their health. As for the housing condition, if necessary living facilities (such enough space for living and qualified drinkable water) cannot be provided, the residents' wellbeing may also be affected. For instance, they may suffer from infectious diseases like malaria and cholera due to poor sanitation.

However, it is not reasonable to deem that the government is the only responsibility taker for this problem, people also should try to form and maintain a positive lifestyle to reduce the chance of getting diseases. For instance, people should be encouraged to take in more nutritious foods like fresh vegetables and fruits rather than food which is high in sugar and salt. Apart from this, exercising on a regular basis is also beneficial to build up our bodies, which reduces the chances of falling ill. Otherwise, people still have great odds to get diseases resulted from their poor living habits.

To sum up, it is necessary for governments to take measures to ensure a pleasant living condition, but citizens also should be responsible for their own health.

公众号：雅思情报圈

范文 2:

It is true that the increasing variety of environmental pollutions and poor housing conditions such as poor sanitation, crowding and inadequate ventilation, are associated with wide range of health conditions. Still whether these two aspects should be the main focus for the decision-maker in the attempts to prevent illness and diseases is arguable. More efficient and readily accessible health policies, which cater more for the situation of contemporary society deserve our attention.

A comprehensive health protection system with higher standard, which is directly linked to our well-being is required. As a result of population explosion and urban expansion, human are inevitably

exposed to wild environment, where often harbors viruses and unknown diseases. Protection against all known risks will no longer be sufficed and new health threats have to be countered and new scientific findings must be considered. Resources needed to be allocated to the study and evaluation of risks that can emanate from pathogens, products as well as environmental factors. Also a health surveillance system bears growing significance in spotting and monitoring infectious diseases in order to minimize the probability of outbreaks, especially under current circumstance where massive increase in globalization and connectivity means that virus can spread from one side of the world to another in mere hours.

Besides, the accomplishment of this task does not simply lie with the authorities side. It requires the collaboration and coordination from individuals, as if knowledge about the causes of diseases and illness and awareness about ways and importance of prevention was limited, the effectiveness of health promotion will not be guaranteed. Such concern, therefore, necessitates a strong leadership of government in improving health literacy and enforce sanitary codes through the provision of information, public advertisement and structured education, which is particularly important in poorer areas, such that vulnerable populations are empowered to engage in early and sustained health promoting actions.

In conclusion, although pollutions and housing problems remains contributing factors of illness and diseases, revising current health system is more adaptive to today's world and encouraging joint efforts of both the government and the individual is essential to assure the public' health.

双边类 公民饮食健康该由谁负责

The government has the duty to ensure its citizens have a healthy diet, while others believe it is individuals' responsibility. Discuss both views and give your own opinion.

范文:

It is argued that whether the government has the obligation to participate in an effort to stem the country's increasing epidemic of obesity and a host of other chronic problems resulting from unhealthy diet. Although it appears to be more to a matter of personal choice, personally, I believe that there leave some actions to be desired from the authorities side.

Admittedly, people have every right to live their own life especially in the aspect of food choice. Therefore, it is the individuals who are to be blamed if they unfortunately fall into unhealthy eating habit. For example, because of the lack of self-discipline, people cannot resist the urge to order a decadent dessert or deny themselves the pleasure of snacks and junk food. Or for people who value work above health, they starve themselves all day, and then gorge themselves until bedtime or eat on the run, standing up or while driving.

Such as it is, however, the government still has much of a role to play in the attempts to safeguard the health diet of its citizen. First of all, the government could revise dietary recommendations and guidelines that emphasize proper nutrition and motivate personal initiative in maintaining a healthy diet, as it is indicated that the overwhelming majority of people have little nutrition elementary knowledge, dietary safety common sense and cooking knowledge. Secondly, it is the responsibility of the government to take every possible measure to ensure food safety in the country. Administrative systems need to be created administrative systems in a bid to prevent food safety incidents and raise the overall level of food safety. In a fight against the illegal use of additives, people can only count on the authorities to intensify supervision and increase penalties for violators.

In conclusion, it requires the effort from both sides to address the prevalence of unhealthy diet. The government definitely has an essential part to play in an effort to reverse the situation.

观点类 商店不得出售对健康有害的食物和饮料

Shops should not be allowed to sell any food and drinks which are proved to be scientifically harmful for people's health. Do you agree or disagree?

范文:

I shall argue in this essay how irrational the claim of voting the prohibition of selling food and beverage that are proved harmful to people would be.

Before assessing whether those types of food intake should be forbidden or not, one should first make a clear definition of “harmful”. Anything that is eaten by people in their daily life may become “harmful” if without scientific eating amount or frequency. That means all food or beverage, nutritious or unhealthy, would somehow become toxic anyway if people blindly eat them without considering the physical situations. Therefore, I would say that one can never draw a clear line between regular catering materials and the so-called “harmful” food when there are no premises set on the quantity or eating frequency. Then is the impracticality of the supposed policy: how can we solely ban the selling of certain types of food only when they are relatively more “harmful” than others, but permit others that are less that harmful but would also be unhealthy under some circumstances? It is the ambiguity of the criteria towards this actions that compels me to reject this notion.

Apart from the lack of credibility on the judgement of “harmfulness”, the given claim would also be unpersuasive because of its recklessness. This type of prohibition is practical only when its foreseeable contribution definitively outweighs the drawbacks it may provoke. Let alone how hardly the act can be implemented, the possible outcome of this is clearly dark and negative; it would certainly deprive certain catering industries of the ability of survival and would make the entire society face the sadness of unemployment. Companies related to, say, snacks, alcohol or soda, would immediately witness their fate of extinction and end up with corruption, sending a throng of fired employees into the talent market, who would suddenly increase the pressures pushed on the government and human resource departments. Whereas that is still not the whole story, when lots of countries then realize that they would experience vicious slumps in their international trade, in which the old days economic titans—coca cola, KFC, burger king, Hennessy, etc.—would never make any money for their own countries, who would also not be that abundant to purchase inside the global importing and exporting chain.

In conclusion, the absurdity and the calamities witness behind this notion make me strongly veto it and I certainly believe that feasibility and possible hazards should be meticulously testified before any prohibition of food and drinks, even if they may be seemingly harmful to our health.

利弊类 设施训练顶级运动员，还是人人可用

Some countries achieve international success by building specialized facilities to train top athletes instead of providing sports facilities that everyone can use. Do you think it is a positive or negative development?

范文：

Compared with proffering sports facilities for common people, some countries lay more emphasis on the construction of professional facilities for elite sportsmen in order to succeed internationally. When talking about the merit and demerit of this development, i think the former may weigh far higher than the latter.

The benefits of this tendency can be perceived in many aspects. First and foremost, to cultivate more exceptional professional players plays a role in raising a nation's status in the international arena and thus acquiring economic profit. If given training bases equipped with the latest devices and technology, the sportsmen are more competent to get the triumph on an international stage. The exalting glory proves the great competitiveness in sports and helps a country to stand more opportunities of bidding for some major international sports events such as Olympic Games and Football World Cup. Not only do these events serve as the ideal platform to present a nation's unique strengths, but also generate enormous economic value through the ticket sales, accommodation and visitor consumption. Moreover, the hard-won success can also fulfill the educational function to the general public. There is no exaggeration to say that champion in one important sports event never fail to inspire the citizens' patriotism. The winner can set a role model for numerous youngsters who can learn some valuable characters from their hero such as diligence, self-discipline, persistence and so forth.

On the downside, the allocation of fiscal budget on advanced sports facilities designed for boosting the performance of professional players may only benefit a small group of people. It is common sense that the money from tax-payers should be spent for the interests of majority of the public. Besides, the inaccessibility of sufficient pubic sports facilities can be partially responsible for the decline of public enthusiasm for body-building.

To conclude, I believe it is worth advocating for countries to place value on nurturing professional athletes and providing them with cutting-edge facilities considering the economic and educational benefits. Meanwhile, these sporting venues should be open for the common occasionally so as to promote the public participation.

双边类 危险运动是否被禁止

Some people think that the government should ban dangerous sports, but others think that people should have freedom to do whatever sport activities they choose. Discuss both views and give your opinion.

范文 1:

Recent decades have witnessed that dangerous sports events, such as mountain biking, rock climbing and scuba diving are prevalence among office workers, especially among those dynamic young ones, but several accidents have been reported due to these sports as well. Therefore, there are some people who argue that the government should ban these activities while others believe that it is people's own choice and the freedom to do whatever they are fond of. Personally, I prefer the latter idea.

First of all, all extreme sports, such as hang gliding and alpine climbing, involve a high degree of danger, but many people are willing to risk their lives to enjoy the excitement. They do this for various reasons, and one of them could be that they need a way out of their monotonous sedentary life. They push themselves to the wild, to the alpine and deep into the sea. By doing so, they extend the limit of both their mind and physique, and find the meaning of their living. This can be conducive to their personal development.

Besides, with the technological advances and stricter regulations enacted by the government, citizens can enjoy the hazardous sports without risking their life anymore. Currently most dangerous sports, such as diving, have rich theoretical basis and high-tech supporting equipment. Therefore, before people taking part in it, they should carry out professional training under the guidance of the coach to learn how to use the equipment and precautions in dangerous sports. Meanwhile, in the process of participating in dangerous sports, tutors will also accompany the participators during the whole process, which greatly reduces the risk of dangerous sports.

Admittedly, some perilous sports activities might become the roots of injuries and agonies. Dangerous sports require a high level of physical fitness, and those who have a history of mental illness or encephalopathy may adversely affect their health if they insist on participating the activities. However, the participators should ensure their physical conditions and the organizations pay special attention to the maintenance of the facilities, the tragedies can be avoided to a large extent.

To summarize, despite the motivation this approach may provide, I am firmly convinced that people have the freedom to do the dangerous sports mainly because of the excitement and security system provided by the current hazardous sports currently.

范文 2:

The contradiction between the personal freedom and apprehension about dangers has been a paradox that frustrates us when deciding whether to engage in a sport or not. It looks to me that none of which should be crowned as the golden rule that works with all physical activities regardless of other determinants, and therefore a combination of both freedom of choice and safety concern are needed when choosing to participate in any sports in terms of various conditions.

On the one hand, I think it irrational to ban any sports solely for the reason of safety. The crux of the argument is the ambiguity about the definition of 'dangerous sports' – any physical activities could be reckoned as risky without needed protective measures. There are many sports that might lead to potential risks, such as the boxing or car-racing, but we do not expect them to be prohibited. Rather, if there were clear code of conduct and safety equipment to mitigate the potential harm, the so-called 'dangerous sports' might not be an issue and therefore pointless to be constrained.

On the other hand, it does not make sense to me either that others outweigh personal freedom over other determinants when choosing to participate a sport. I doubt there exists absolute freedom unhindered by other factors; whether these be threats to individual's life or public safety. One of the most controversial examples is the bullfight, which has long been a dilemma featuring the controversy between personal freedom and threat to life, not to mention the violation to the belief of animal right campaigners.

In conclusion, I am convinced that neither of the two opinions is justified enough to illustrate the entire picture of the problem. It will be too simply-minded to ban a sport without the comprehensive evaluation of its risks and possible solutions; so is the freedom principle, which does not work in all conditions. Both arguments deserve their justifications and can be taken as a reference in particular context.

公众号：雅思情报圈

双边类 比赛胜负取决于身体还是心理

Some people argue that the fittest and strongest individuals and teams can achieve the greatest success in sports. But other people think the success is much related to the mental attitude. Discuss both views and give your opinion.

范文:

It has long been a controversy what is the decisive factor in sports, physical or mental strength. To me, I tend to say that it is the spiritual energy that wins me over, with its exclusive advantages in inspiring individuals and teams.

It is easy to understand why the physical qualifications are usually reckoned as crucial in sports. Talk about sports, it has been a traditional assertion that it is a realm dominated by bodies instead of minds, as is seen in events like boxing, racing or football, all of which require athletes to possess the above-average endurance, agility and quickness to defeat opponents. It is these physical features that make Michael Phelps surpass all his competitors, or enable Mike Tyson to down all the challengers.

However, at the other end of the scale, stand those opponents, who believe that the decisive key of success in sports hinges more on spiritual power than on muscle strength. Instead of physical capacity, what supports many athletes to insist and win games is the indomitable will, particularly when they are falling behind.

Also, another benefit of mental strength lays emphasis on the team spirit, which cannot be achieved by any material force. It is the common sense of honor that can unify various talents into a team, regardless of their divergence in personalities, political or religious beliefs. Taking this factor one step further, the morale, which is also pivotal in winning a game, is inextricably bound up with the spiritual power in every athlete's mind.

Given this, although the importance of body strength in sports cannot be ignored, I would say that athletes with a never-say-die spirit in mind is more compelling to me than those fit and strong in body.

双边类 制药公司为穷国家研发药品 VS 挣钱为目的

Some people think the responsibility of medicine companies is to spend money on researching medicines for people from poorer countries, while others think the main responsibility of medicine companies is to make money. Discuss both views and give your opinion.

范文:

Some people assert that medicine companies should focus on helping poor people, whereas others believe that the business is entitled to make money. It looks to me that both views are not antagonistic to each other; it is only a question of different emphasis.

On the one hand, it is easy to understand why it is taken for granted that the pharmaceutical companies should prioritize social responsibility over profits. From the perspective of the advocates of this, one thorny problem that exhausts many governments is the unaffordable cost of medical treatment, which is reckoned to be culpable for millions of unnecessary deaths every year. For example, in developing economies like China, people are reluctant to go to hospitals just because they cannot afford the medicines. Considering this, the medicine should first serve as something to cure diseases and save lives, then a product to earn money.

On the other hand, plausible though it is, the argument is not justified enough to silence the shareholders of those medicine corporations, whose concerns lay more emphasis on the survival of their business, the rewards of investors, and the employment as well, not to mention their tax contribution to the government, which in turn, could be used to subsidize the public medical services. As well as these pragmatic determinants, a more important factor we cannot afford to ignore is the enormous investment for researching new drugs, which definitely comes from the income of selling medicines. How could these companies maintain new projects without stable economic return?

In conclusion, it looks to me that both arguments deserve their justifications in certain circumstances. From the perspective of patients, pharmaceutical businesses should not allow the prices above certain level so as to make it affordable for the masses who need them most. On the other hand, these companies deserve modest profit to invest on the sustainable research for the new products, which in turn will benefit everyone.

利弊类 研发新药和新疗法该由谁来资助

Researches into new types of medicine and treatments are essential for improving health and dealing with diseases. Who do you think should fund these researches: private companies, individuals or governments.

范文:

It has long been a controversy about which should be the best financial source for the research of medical science - businesses, the public or authorities. Although private agencies and individuals do have their roles to play, I tend to say it is the government that should pay more responsibility for the development of new drug and medical treatment.

The primary reason why I believe the money should come from governmental budget is that the state fund is mainly contributed by taxpayers, meaning that it is justified enough for the authority to finance the public health. Another factor we should not afford to ignore is the sustainability of the financial support. Considering the scale and the chronicity of the investment, I doubt there will be other alternatives more reliable than the governmental commitment.

On the other hand, some might take it for granted that it should be the task of pharmaceutical companies, given their advantages in capital, technology, and professionalism. Nevertheless, what is ignored by the advocates of this is that business agencies are driven by profits rather social responsibility. If they were to venture into the research, the cost would be passed on to patients in the end, which inevitably means unaffordable medical services for ordinary people.

As for the other option of imposing the cost on individuals, what concerns me is the practicality, as the policy would not be in everyone's interest. How can we oblige every male to pay for the research of medicines for breast cancer, a disease exclusively for women.

In conclusion, before we find feasible ways to handle other financial sources, I tend to say the government fund is by far the better option to subsidize the medical research for public health.

观点类 政府花更多的钱预防疾病更好吗？

Some people think it is more important for the government to spend more money promoting a healthy lifestyle in order to prevent illnesses than the treatment for people who are already ill. To what extent do you agree or disagree?

范文：

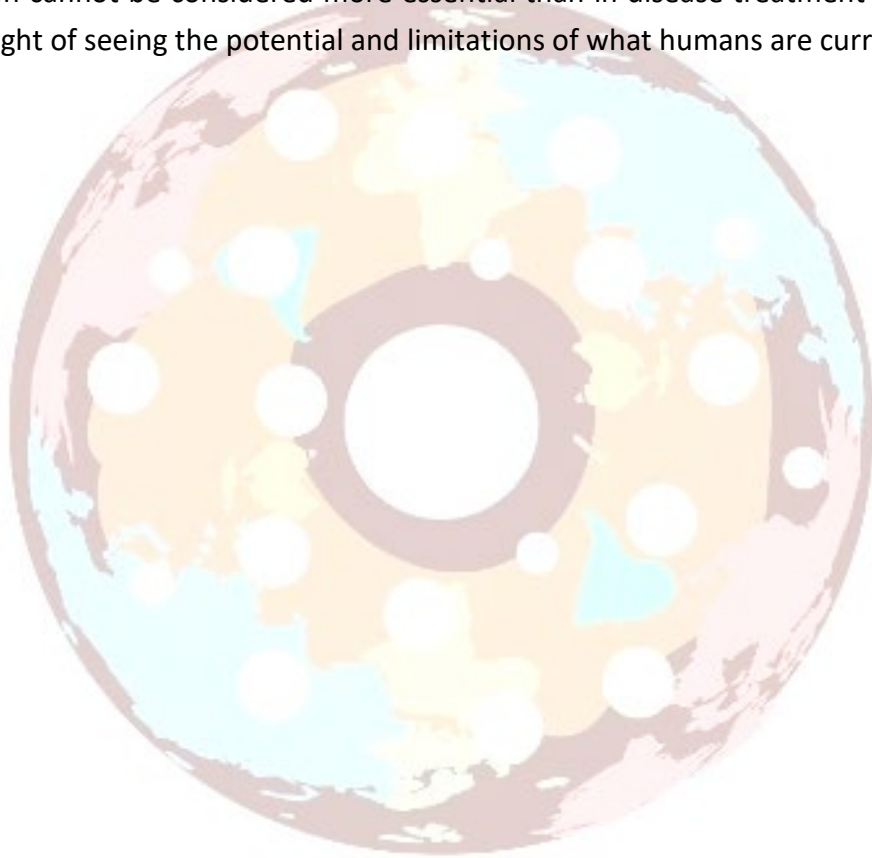

To access whether something is more important than another, I might have to first consider how to define certain utterances made by this topic. From the perspective of the government, there is of course a casual definition of what type of government financial output is “more important”, and usually it is the money that is used to benefit the overwhelming, but the take home message is that this rests entirely on how the “importance” and other utterances given in this claim are defined.

There are, of course, people out there holding that the government spending should be better given out to prevent diseases from happening via promoting public healthy lifestyle rather than to treat those who have already been ill. To them, the quantity of people who are currently without health problem but awaiting a better living condition is always larger than that of the latter, and that means the macro-economic allocation should be firstly fulfill the need of most of the money contributors, the tax payers if you will, to make sure the investment is persuasive. The financial flows are easily witnessed and considered widely useful if they are used to things like organic food produce, fitness facilities set in residential surroundings or even a better air condition, since this is much closer to the daily health of the overwhelming and would be somewhat easily proved to avoid certain food-related, sedentariness-driven and pollution-oriented illnesses. Whereas the expenditure that is invested in medical industry seems comparatively “invisible”, as it is always enjoyed solely by the minority who are put into the physical problems, and would be also hard to judge whether this money would be finally valuable, since there also exists failures in the treatment; sometimes it sounds obscured to verify whether the cured patients get well because of the financial input in the medical facilities or just because of their own immunity.

The kind of recklessness presented in the aforementioned paragraph, as others would argue, is the rankest of all. This type of psychology doesn't allow one to deeply think real importance that the investment in medical area may have, and robs them of the opportunity to recognize the potential hazards and irrationality that lie. No matter how important a healthy life is to be promoted, one must admit that in some cases, we humans, as a organically sophisticated, protein-based species, are still limited in deeply realizing what is a pure “healthy lifestyle” to our physical system, and how the lifestyle that is deemed “healthy” by our current knowledge can effectively “prevent illness”. Then it is not surprising that in the hygiene history, some paradoxical health laws that had been frequently published, considering certain living habits would be meaningful or harmful, have finally been proved unacceptable. Yet this is still not the entire truth until we have also realized that for certain illnesses,

the solely healthy lifestyle is certainly not enough, and people would definitely be pushed into disasters if there is no systematic medical expertise, facilities or resources in dealing with them; in that case, to invest in healthy life promotion is certainly no more important. The myopic thinking given in the prompt distracts us from rationally thinking what the “importance” truly means; it is then incomparable between the two investment directions in terms of the importance because of our still limited knowledge to our current health care, and to, if at all, the unknown future.

In conclusion, I would totally agree that the policy of government investing in healthy lifestyle as an illness promotion cannot be considered more essential than in disease treatment since I too share the gift of foresight of seeing the potential and limitations of what humans are currently facing.

双边类 政府应该优先关注医疗？

Some people say governments should give priority to health care, while others believe that taxpayers' money should be spent on other important priorities. Discuss both views and give your own opinion.

范文：

The year of 2020 witnesses the global contagion of coronavirus and some inappropriate strategies in the early stage of spread compounds a broader deterioration in the crisis, which has aroused people's thinking about the priority of government conducts. Some people argue that the government should give exclusive priority to issues related to health, while others believe that the government should take precedence over other crucial civil projects such as infrastructure and education.

Making health care as a priority investment can achieve both short-term and long-term returns. Especially in the case of current epidemic, a large number of people in different countries are infected with the virus and urgently need treatments, by which I mean priority investment in health can ensure the stable supply of medical resources, and meanwhile vaccine research aiming at this virus can also be guaranteed, which is of great significance for the uninfected population too. Besides, from the government's point of view, money should be given priority to programs that will pay off in the long run, such as a plan to overhaul the nation's health care system to guarantee availability and affordability. Although with medical costs soaring, businesses may feel the weight of the recession, with this budget the government can make an historic commitment to comprehensive health care reform, which is a step that will not only make families healthier and companies more competitive but over the long term it will also help the government bring down the deficit.

On the other hand, governments' investment should not be confined within the boundary of health care, and there do exist other projects that are of priority concern. For example, in 2020 China is carrying out a comprehensive poverty alleviation work. Specifically, the government is giving priority to the financial and policy support to underprivileged families in deprived areas to help solve the bread-and-butter matters so as to enhance Chinese overall productivity and greatly narrow the gap between the rich and the poor. Besides, education, which also concerns the long-term development of the whole nation, should receive more funds as well. More talented students will be cultivated due to the abundance of governments' financial support, offering more intellectual support to the development of the society. The above projects should be taken as the key consideration direction of the government in the investment process.

To summarize, it seems to me that just as a family has to make hard choices about where to spend and where to save, so do governments, and which project is more priority should depend on the

specific national conditions at that time, as long as the government investment can ultimately improve the well-being and stability of taxpayers themselves.

报告类 孩子打电脑游戏而不运动

Today many children spend a lot of time playing computer games and little time on sports. why is it? Is it a positive or negative development?

范文:

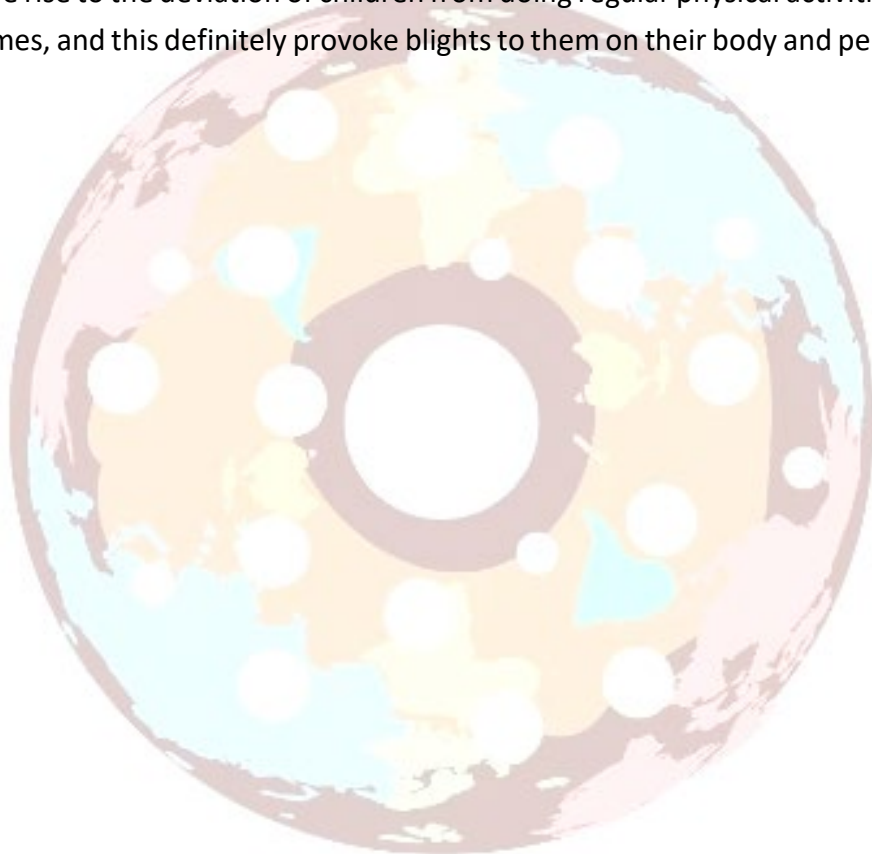

More facility, and amusement brought by engaging in computer games than in physical exercises lead to the young leaning their attentions towards those electronic products instead of doing sports. This would be negatively linked with their physical and mental welfare.

The trend mainly results from the prosperity of computer gaming industry, with a relatively stagnant or even adverse development in daily sports businesses simultaneously. What we have to admit is that it is way too easy for today's children to start a battle or a competition at any time in front of a laptop or desk screen: the smooth process of the game software, the fluent and swift internet communication make youngsters to do so. The living surroundings for most children, however, put harsh obstacles to their willingness of doing outdoor exercises. Communities are squeezed together, providing limited spaces for people to go through (sometimes are occupied by shameless private cars) and hardly a room for kids to play. Children may have to travel further to the athletic facilities, but may have to wait for a vacancy when seeing too many exercisers doing activities, or for an opportunity to gather all their teamers at one time; this would never be a problem in a cyber arena—millions of partners and rivals are waiting all around the world. The excitement gained from those games, on the other hand, is to some extent far more than what the sports would confer to the children. They can make endless possibilities in the virtual world, becoming heroes or team leaders, holding up weapons to fight for a super goal or fulfilling their fake dignities that may never be easily gained for the most in the stadiums or playgrounds. The design of games also perfectly meets their clients' demands, with glorious scenarios, view spots and fight scenes, scientific playing time slots and considerable rewards to draw the attentions of the young from their exhausted, sweaty physical activities.

It is hardly far-fetched to imagine just how deeply the situation would negatively impact our next generation, not only in terms of their physical conditions, but of the mentality and personality formation. Healthy problems may be initially be witnessed when children choose not to go out for sports, but to ensconce themselves "permanently" in front of LCD monitors: ocular disorders may happen accompanied with their long-time staring; obesity is also likely if they are sedentary and never take exercises during their leisure time. A vicious skeletal development may bring about life-long damage to them during their puberty staying at the chairs or couch whenever they are studying or relaxing by doing nothing related to their fitness. The reality seems even harsher if we consider the following-up consequences brought to these youngsters' personalities: a reckless indulgence in electronic games may easily distort their attitude of facing problems or persons in the real life.

Escapism fostered in too much game playing would highly weaken their ability facing real problems, since those immature, low emotional quality individuals may definitely avoid difficulties by fleeing into the virtually heroic world, where they can sense the achievement by just moving fingers on their keyboard and mouse; physical weaklings derived from lack of physical trainings are also likely to be introverted and short for self-confidence in forming inter-person relations with others, or they may become more eccentric by too frequently getting in touch with just devices but not real persons.

In conclusion, the electronic product booming and the relatively sluggish condition of daily sports industry may give rise to the deviation of children from doing regular physical activities to be addicted to computer games, and this definitely provoke blights to them on their body and personal characters.

混合类 退休的人孤单且不健康的原因及解决方法

Some health professionals suggest that older people spend more time socializing with others and playing sports to stay healthy, but many retired people have experienced loneliness and a lack of fitness. Why has this happened? What can be done to address this?

范文:

Social creatures as we are, our connection to others enables us to survive and thrive. Yet, as we age, many of us are alone more often than before, leaving us vulnerable to social isolation and loneliness and related health problems. Fortunately, there are ways to counteract these negative effects.

It is true that loneliness can affect anyone of any age, but older people are particularly vulnerable to feeling lonely. Older people's social networks often get smaller for a number of reasons. After retirement, people might miss day-to-day contact with their co-workers as well as the routine of getting ready and going out to work. It is quite different being on their own seven days a week, rather than just at weekends. As people grow older they are more likely to lose loved ones, aging siblings and friends or their children may moved away, along with grandchildren. Worse still, chronic loneliness will set people in a stage in higher risks for a variety of physical and mental conditions, because people who feel lonely may have weakened immune cells that have trouble fighting off viruses, which makes them more vulnerable to some infectious diseases and other problems such as high blood pressure, heart disease, obesity, anxiety, depression, cognitive decline and even death.

There exist some potential interventions to address loneliness and increase the level of health. Having a sense of mission and purpose in life is proven linked to healthier immune cells. The community-based program could be devised to enable the old to work for a social cause and get to know people who share their values and form relations with trusted partners puts them in contact with others and help develop a greater sense of community. Also, they could be encourage to keep up with an exercise routine, even for those who suffer from a chronic illness or have been sedentary for some time, as there always are safe, easy and comfortable forms of exercise include walking, swimming and cycling.

In conclusion, loneliness does not happen overnight. It is something that creeps up as personal circumstances change and feelings of isolation increase. Conversely, people who engage themselves in meaningful and productive activities with others are more likely to maintain their well-being both physically and mentally.

教育类

观点类 为照顾好孩子父母应参加育儿课程

Taking care of children is important, so both mothers and fathers should take childcare training courses. Do you agree or disagree?

范文:

Both positive and negative effects of childcare have proven to be long lasting. Therefore, there has been a surge of interest in arranging childcare courses for parents. Although it seems to be overreaching to require both parents' participation in professionally organized childcare training, personally, I believe that both parents' participation is advisable for the sake of providing growth-oriented environment for children.

The notion that the role of parents is to provide a safe place for children to relax, cater for child's emotional and physical needs, and provide consistent and responsive care is narrow and superficial. Instead, a lot more are expected from the role of parents and the parenting children received. First of all, taking training course allows parents have a clear perspective of what to expect from the child developmentally and are able to nurture his growing skills accordingly.

Simultaneously, researches prove that children's foundational understanding of intelligence and emotion is formed before they even start explicitly learning a curriculum. It is the environment created by the parents that could stunt or facilitate a child's sensory, motor, emotional, and linguistic development. This is not only because children are prone to model everything a parent does and incorporate what they see into their own lives. Also, the home education system adopted by the parents and the level of support given to their children will directly affect their children's intelligence development and problem-solving ability. Therefore, it is crucial for parents to take advice and training on how to behave themselves in front of their children and how to guarantee formal, structured environment for children to stretch and grow.

In conclusion, parents have much of a role to play in the growth of the next generation in more aspects than is generally believed. Those traditional ways of childcare is no longer sufficient.

双边类 父母应给孩子读书讲故事吗

Some people think parents should read or tell stories to children. Others think parents needn't do that as children can read books or watch TV, movies by themselves. Discuss both views and give your opinion.

范文:

Literacy is clearly a hugely important factor in a child's intellectual and emotional development. Literacy is one of the two foundation blocks, along with maths, of a child's education. Without developing basic literacy skills at a young age, children will face great difficulties in their future education. Therefore, it is essential that children are given the chance to develop reading and writing skills from an appropriate age. Both parents and schools have a role to play in this.

It has often been said that parents are a child's first teachers. Given this, it is clear that parents must play a large role in facilitating their children's literacy skills. Reading to children on a regular basis is an important way of achieving this. It cannot be the sole responsibility of teachers to teach a child to read; parents must accept responsibility for this, too. Statistics show that children from middle-class families, where they are read to by their parents regularly, have a major advantage in terms of literacy and maths, whereas children from poorer backgrounds tend to perform less well.

Nonetheless, at some point a child must begin to read independently and do so without parental support and guidance. Many parents act as facilitators of this process, slowly guiding their children towards independent reading. However, allowing children to watch TV and films without supervision is no substitute for reading books, as this will have no positive impact on their literacy skills. Indeed, a child's concentration and ability to read undoubtedly suffer from too much exposure to TV.

Therefore, I believe it is essential for parents to read with their children. Without the guidance of parents in this process, children will not be equipped with sufficient literacy skills to succeed in life.

观点类 老师对孩子智力和社交能力的影响比父母大

Once children start school, teachers have more influence on their intellectual and social development than parents do. To what extent do you agree or disagree?

范文:

While it is inevitable that the shade of parents will follow the whole life of their offspring, I tend to agree with the opinion that since children step into school, it is teachers who play a more influential role in the cultivation of intelligence and social skills of children.

Admittedly, parents, as the first educator in children's early age, do play their part in the enlightenment of literacy and communication ability for kids. Had it not been for the family education, many children would have not forged the basic perception of language or number. It is also with the guidance of parents that young have learned how to talk with others in a polite and respectful manner. Both qualifications are conducive to the further school and working careers of the younger generation.

Significant though the home education is, the influence of parents in education is eclipsed by that of professional educators as children grow. One primary reason contributing to the change is the exclusive proficiency in academic knowledge of teachers, who seems to be eligible to answer all questions of students, making it easy to win those young minds full of curiosity.

So is the case with social ability. School provides a more complicated context for students to learn how to communicate with people with various backgrounds. Without parents being around, the first person students will turn to when exposed in tricky situation is their teachers, whose advices turn out to exert more profound effects on students' style of communication.

In conclusion, although the impacts of parenting cannot be absolutely ignored, it seems to me that it is teachers who have a more important role in the development of intellectual and interpersonal qualities for the next generation.

混合类 父母满足孩子一切要求的好坏和未来影响

Some parents give their children everything that their children ask for or they want to do. Is this good for children? What could be consequences for these children when they grow up?

范文:

It is true that some parents tend to meet all requirements of their children. While people take different attitudes towards the influences on children, I would say whether it is a blessing or not is a complicated problem that depends on how we define the meaning of 'good', and I am also not optimistic to its profound influence on the younger generation.

On the materialistic level, this permissive rearing style is certainly understandable –children who have all their requirements met and are allowed to do whatever they like can fully enjoy the warmth from parents and are more likely to cultivate a stronger self-esteem. Nevertheless, from a more comprehensive perspective, the materialistic satisfaction mentioned above can be considered from an opposite angle: the overindulgence will inevitably lead to many character flaws, say, the lack of self-discipline, the incapability of behavior control, and over reliance on parents, all of which will exert detrimental effects on their later life.

One problem that should attribute to the indulgent parenting is that many of such children are prone to juvenile delinquency. Without self-control of their greed and behaviors, which should have been cultivated at an early age, I doubt these children will obey any regulations or laws when grown up. As well as committing crimes, another apprehension we cannot afford to ignore is the ineptitude, a consequence of their lack of independence since childhood. Such a defect will become the major obstacle in their future careers, from job hunting to problem solving, not to mention the numerous challenges in a competitive adult world.

In conclusion, the relentless responsiveness from parents is detrimental to the younger generation both in their formation of character in childhood and will cast a shadow in their later life.

利弊类 家长在家教育孩子

In some countries, there has been an increase in the number of parents who educate their children themselves at home instead of sending them to school. Do the advantages of home education outweigh disadvantages?

范文:

Home education is something, which has grown in popularity in recent years. As with any debate, there are pros and cons on each side, and ultimately the choice comes down to the needs and abilities of individual child. However, in terms of practicality and feasibility, the seeming advantages of homeschooling may fail to hold grounds.

Admittedly, it could be argued that at home, education can be tailored precisely, working at the child's pace, answering questions as they come up. Also parents can also include subjects that are not typically taught in school but which they want to teach their children, such as a certain religion or subjects related to cultural heritage and language. Even so, due to the absence of formal curriculum, homeschooling will lead to unorganized learning, and consequently, the result of homeschooling, in most cases, fail to live up to what is desired. In comparison, learning in school gives them collective knowledge. Those formal curricula at schools are proper structured and developed by professionals, who are trained in the field and understand the child needs and psychology on a wider scale. Worse still, it is impossible for parents to attend to all aspects of the education and make sure that their child receives a fully balanced and well-round education.

Another consideration would be the adaptability of the children to the social norms. Confined to the comfort of the home, a secured surrounding, home-educated children are far less prone to peer pressure and meanwhile, peer interaction is hindered. The homeschooled children are denied the opportunity of healthy competition, which inspires them to break their limits and achieve success to their maximum potential, while school education entails atmosphere of learning from their peers as well as skill of thinking from different perspectives and avoid the possibility of being narrow-minded or biased in their opinions as the children tend to carry forward the beliefs of their parents and tutors. Apart from that, in classroom setting, children have multiple opportunities to interact and work collaboratively with their peers, which will help to prepare them to be accepted and fit in the unavoidable workplace or social occasion in the future.

In conclusion, although it appears that home education cater more to the character

双边类 孩子至少七岁以上才能上学

Nowadays some people say that children should go to school as young as possible. While others believe that children should go to school when they are at least seven years old. Discuss both views and give your own opinion.

范文:

While it has long been a controversy whether children should be sent to school before they are seven years old, I would say it is not an either-or question that we can jump to a conclusion without recognizing all possible variables: each view has its justification in terms of the different concerns of individual families.

From the perspective of many parents, the advantages of early school education marry well with their expectations for the next generation. Parents are usually preoccupied with potential challenges which their children will face; for example, the burden of study, the peer pressure from those overachievers in the class, etc. With this in mind, young couples are prone to send their loved ones to school at an early age: young children can be better prepared for some knowledge that needs to be acquired in formative years. One compelling example is the linguistic ability, which is reckoned to be better acquired before the establishment of self-consciousness at younger age. Another beneficiary of early schooling we should not forget is those working parents themselves: by doing so, adults can afford more time and stamina immersing in their own careers, which is particularly important for families living on tight budget.

Plausible though the argument seems, at the other end of the scale stand the opponents who believe that formal education should not start until children are 7-year old, when they reach the age of reason. Parents, due to their obsession with fears from an adult perspective, tend to be oblivious to the feeling of young children, who are not mentally prepared for a new environment and need more accompany from family members than teachers in their preschool years. Another apprehension we cannot afford to ignore is the physical maturity of toddlers. Scientific evidences have shown that human brain has not fully developed to accept advanced skills before the age of seven, which explains why it is legalized as the starting year for primary school in most countries.

In conclusion, it looks to me that it would be simple-minded to label either of the two opinions as more justifiable if we do not take into consideration different circumstances – a flexible combination of the two models could be applied according to the specific needs of individual families.

范文 2:

I would discuss in this essay why neither of the two views is persuasive enough, and I certainly agree that there should be a minimum age for the school access but it should not be always that fixed.

The opinion that children should go to school as soon as possible sounds not so doable because of its ambiguity. It is reasonable that children are allowed to go to school when they are ready to accept education mentally and physically, and that is why people think they are supposed to enjoy their study life “as soon as possible”. However, the only problem is that no one can define what type of personal condition is possible enough to go to school. One could indeed be testified with related examinations to ensure whether he or she is proper enough to go to school, but the related measurements can never be that sound to ensure such kids can always focus on their learning process if put in school when they are too young, or even more severely, it would not be harmful to deprive them of the freedom in their childhood. If so, that is certainly not “possible”, and the potential hazards would be certainly hidden if the children were truly sent to school too soon.

The concern above leads to why some consider the regulation of setting up a minimum age limit for children to go to school, but this should not be always a fixed age. I believe this restriction may have been examined by experts or anthropologists and it seems to be the most scientific time to provide most infants with elementary school education since they may be mature enough. However, would it be too strict a rule for the entire world to obey without considering, say, the actual contents of different types of education, or other personal conditions of the next generations in different countries? What the policy has failed to be practical is that it just has fixed the minimum age of students, but not involved the education modes or other related standards at the same time: rules could certainly be different if the first-step education in a country is relatively easy even if the students are much younger; sometimes the limitation has to be more rigorous when children are inculcated with more difficult knowledge.

In conclusion, I would agree that related criteria should indeed be given on what age is the best timing for schooling, but must be well-rounded enough by considering as many determinants as we can.

公众号：雅思情报圈

利弊类 孩子从小刻苦对其的积极或消极影响

In recent years pressure on school and university students has been increasing and they are pushed to work very hard from a young age. Do you think this is a positive or negative development?

范文:

In order to answer this question effectively, it is necessary to consider it from two angles. First, we must ask: what is the benefit of intensive study for children? Secondly, it is important to assess which other factors may be important for a child's development and educational performance, aside from academic achievement.

Without doubt, children today face considerably more pressure to achieve results at school and university. The competition for places at elite education institutions is growing more intense and it is not uncommon for young people to suffer mental issues due to the pressures they face. Nonetheless, this pressure, some might say, is necessary in an increasingly competitive world economy. In order for young people to be fully equipped for the challenges they will go on to face in their work and life, they must be adequately prepared at school and university. To that end, the pressures they face could be interpreted as a necessary evil.

Even so, despite the importance of education and the undoubted necessity of preparing children for the tribulations and difficulties ahead, it is also essential that attention is paid to the emotional and mental well-being of young students. The increased pressure imposed on students, alongside the rise in mental health issues among the young, is in danger of having a detrimental, long-term effect on the lives of the individuals in question, as well as having broader drawbacks for society as a whole. While it is vital to have a workforce equipped intellectually for the pressures of the dynamic modern economy, it is also important to ensure the next generation of entrepreneurs, doctors and business leaders are well-adjusted emotionally.

Thus, it is important to strike a balance between academic success and emotional well-being, by ensuring academic pressure is met with emotional support.

范文 2:

Suffering from mounting pressure, students begin to participate in a variety of tutoring classes or art classes from their childhood, as it is a must for them to work harder compared with the previous generation. Tough as it sounds, it seems to me that this is a positive development.

In spite of the fact that this may deprive children of the lightness and happiness of childhood that they could have enjoyed, it is worth mentioning that this can actually bring more happiness to a person throughout his life. For individuals, every child has a sensitive period of physical and mental development when he is young, for example, 4-year-old is the sensitive period of learning mathematics, and if parents seize this period to guide children's interest in learning, children's potential can be greatly developed, which is conducive to future development. In other words, for those who have been forced and trained to study hard and acquire various skills early, there would be more possibilities for them to use their knowledge and skills to do whatever they really like in their adult life and achieve success eventually. This kind of happiness, which comes from fulfilling the need of the self-actualization, is much superior than other basic needs, according to hierarchical theory of needs raised by Maslow.

Apart from the achievement of personal ambition, governments can also substantially benefit from it. In other words, if citizens can cultivate their own quality from an early age, then in the future, the government can obtain more talents with refined academic performance or skills, which may substantially contribute to the social advances since they can not only bring out more technological innovation, but also explore the suitable economic development pattern to ensure the balanced and sustainable development of the country. What should be mentioned that the stable development of a country is also closely related to the happiness of local citizens themselves, by which I mean when the facilities and equipment are optimized and become more completed, the well-being of inhabitants themselves would be considerably enhanced.

As a young mother, for me, forcing my little daughter to study hard is not about earning outstanding wealth or reputation, but helping her explore more possibilities of her own life because of her efforts since childhood, and meanwhile the world can make some positive changes because of her existence, which seems to be the essence of human reproduction and inheritance.

公众号：雅思情报圈

报告类 如何给孩子减压减负

Children are facing more pressures from academic, social and commercial perspectives. What are the causes of these pressures and what measures should be taken to reduce these pressures?

范文:

In this day and age, parents, schools and even the society as a whole expect too much from a child, laying heavy pressure on these children. The reasons are obvious and how to strike a balance between study and life seems to be a thorny problem for our next generation.

It is not difficult to find the culprit of high pressures concerning academic, social and commercial perspectives exerted on children. Firstly, there is no denying that high-quality educational resources are relatively limited, which aggravates academic competition and high expectations from parents also encourage children to suffer from increasing study pressure. In terms of social stress, the fierce peer competitions among classmates are likely to result in hypocrisy and end up causing broken friendships. Besides, with the rapid development of the Internet, overindulgence in the virtual environment, to some extent, promotes stress and even worsens anxiety as well due to some potential cyber bullying. Meanwhile, economic dependence and increasing expenditure on daily life leads to mounting financial pressure. It is known that a large number of advertisements appeal to children, a consequence that they are prone to pester their parents to buy some expensive or unwanted commodities.

Nevertheless, it is never easy to alleviate these pressures and potential measures should be taken immediately to improve the situation. The governments' priority is to optimize the distribution of educational resources so as to provide equal educational opportunities. For parents, they should take children's real situation into account and set a practical learning target for them; they also have the responsibility to cultivate children's awareness of financial management to avoid the behavior of wasting money. When it refers to students themselves, adopting a rational attitude towards peer competition and cutting down some useless social interactions is of great significance.

In conclusion, children today are being pushed beyond their capability to pursuit for success in the aspects mentioned above. It is highly recommended that parents, governments and students themselves should all do their part to tackle this issue.

范文 2:

It is commonly said that there are increasing burdens on children academically, socially and commercially. Personally, I believe that the mounting pressure from domestic expectations, peer competition and impoverished background are the three main culprits for this situation.

First of all, many parents place numerous expectation on their children as for the academic performance. In order to achieve excellent attainment and not disappoint their parents, children have to study hard and sometimes they may struggle through impractical educational requirements from their parents, which brings huge stress to children. Besides, it is undeniable that mounting peer pressure also contributes to this problem. Due to the soaring number of students, pupils now are facing increasingly fierce competition from peers, and in order to come out on top and succeed, they must put more effort to be well-rounded and compete against others, leading to enormous pressure on students. Another reason can be attributed to those students from impoverished background, affording expensive tuition fees and living expenses could press heavily on them. They need to work their way through college or manage for the scholarship, so this is why our next generation could possibly face financial challenge and suffer from commercial stress.

To ease this situation, parents should be educated to find their children's potentials and set goals within their capability, rather than simply push them to unrealistic limits. Meanwhile, schools and teachers need to provide adequate patience and guidance for students, mitigating their psychological pressure from peers and raise healthy competition. Finally, more institutional opportunities should be offered for students, especially in developing countries so that the economical burden on poor students can be alleviated. For example, offering scholarship and student loan can be regarded as the feasible way to assist the students from underprivileged households.

In conclusion, it seems to me that enhancing the academic performance, providing sufficient patience and chances are the three solutions that I came up with.

公众号：雅思情报圈

利弊类 学生花大量时间学习

Children spend long time studying in school and after school. What are positive or negative effects on children and the society as a whole?

范文:

For children, it is important to keep the balance between study and leisure. However, they are forced to spend long time studying not only in school but also after school. I believe it has negative effects on both children and the society.

Long-time study has unfavorable influences on children's health and social skills. Those who are busy with Mathematics or Chemistry would lack the time to play basketball or football on playground, which may lead to a sedentary lifestyle. This is the main reason why some primary students suffer from obesity and poor eyesight. In terms of social skills, when children are required to listen to teachers, do homework and have tests frequently, there will be few opportunities to communicate with other people except their teachers and classmates. In the long run, their interpersonal skills will not be improved.

Also, the diversity of the whole society will be limited because of it. 8 to 13 is the age to discover and explore the world. But when their leisure time is used to sit in front of the desk and focus on textbooks rather than being exposed to the nature, they will not have time to find the wonderful aspects of the world. Thus, in the future, there might be more 'nerds', who just have a good command of what books and teachers told them, and fewer creators.

In conclusion, overlong time on studying brings a lot of drawbacks to children themselves and the whole society. Children should be released from books after school to give way to color their life.

公众号：雅思情报圈

利弊类 孩子拥有更多自由的利弊

In many parts of the world, children have more freedom than they used to have. Do you think it is a positive or negative development?

范文:

The topic exhibited in the prompt fails to express certainties to the so-called “more freedom” children are entitled to have, because the differentiating areas and extent of more rights enduing young generations may give rise to diversified consequences, contributively or catastrophically.

More rights concerning to certain respects given to the children themselves may admittedly contributive to their future, with simultaneously the blighting effects emerging when they are harboring freedom in others. Supervisors may surprise because the kids are extremely focusing and motivative when they have chances to opt what they can research or make a deep pace in subjects or interests they truly like in their schoolings and daily lives. Wide ranges of experiments may be implemented by them; multiple books and profiles may be got access to during the process, most of which are just derived from the enthusiasms rooted in their minds in choosing what they are really fond of. While these rights can definitely not be released in choosing their daily habits or behaviors, since they are not mature enough to distinguish what is proper in their age ranges, but may imitating what they perceive from the mass media or their surroundings (smoking, drinking, or violent and bullying actions), thus provoking severely negative consequences.

Degrees should also be meticulously considered when regarding the trend as positivity or drawbacks. Children may be led to comparatively bright life attitudes and pleasant childhoods when they have the rights to struggle for what they are obsessed with to a reasonable extent, some of which may involve the possibility to relax or to launch playful activities in some particular periods. Whereas those freedoms should be rationally manipulated not to endue them too much, since the indolence planted deeply in human nature would preclude them from jumping out their comfortability when they are too willing to indulge in their well-being situations.

To sum up, increasing the freedom to the juveniles should strictly be considered on their maturity and mentality in terms of the category and degree, to set up a clear strategy that may contribute to their futures.

报告类 小孩喜欢看电视的原因和解决方法

Studies suggest that children spend more time watching TV than they did in the past and spend less on doing active or creative things. Why do you think it is the case? What measures and methods can be used to tackle it?

范文:

The advent of television has remarkably transformed the recreational methods of young children who were more into games, like hide-and-seek, in the park after school. The preference of children to appealing programmes shown on television has raised concerns about its impacts on these young viewers. The objective of this essay is to outline both the sources of the preference and appropriate approaches to cope with it.

From my perspective, first of all, parents should be the first role we should blame for. Living in this competitive society, parents are either too busy for work or too exhausted afterwards to spare time or energy to accompany children. The television renders an option for them to calm their fussy children and relieve themselves at the same time. In addition, Thanks to the continuously betterment in life quality, there is a growing affordability for not only television sets but also ingenious electronic devices that the youth are able to rely on for manifold digital entertainment. As a result of that, a variety of television programmes designed for amusing and educating the young generation become children's best company and resort at home.

In spite of the fact that these television programmes can enrich children's leisure time, it must be emphasised that spending excessive time before a screen is definitely detrimental to children's health, ranging from the short sight to the lack of outdoor activities. To encourage children to leave the couch, parents can enroll their children in some extra-curricular courses arranged by schools, communities, or some private organisations. By participating in such activities involved into more practice, children can acquire physical benefits to their growth. What's more, parents should spend some time with their children in reading or on some outdoor activities, no matter how busy they are. The close family ties create a healthy environment for the mental development of children.

In conclusion, parents ought to shoulder the main responsibility for children's increasing addiction to television. In my view, only if children are properly guided by their parents, can they fully make use of the merits offered by television.

观点类 孩子沉迷电视和电玩不利于心理健康

Nowadays, children spend too much time watching TV and playing computer games. Some people believe this has negative effects on children's mental abilities. To what extent do you agree or disagree?

范文:

While there has long been an assertion that children spending too much time in TV programs and video games will lead to the detriment of their mental health, I tend to disagree with this opinion in terms of the benefits to children's acquisition of diversified knowledge and qualities.

Superficially, overindulgence in watching television and playing computer games might inflict negative influences on the next generation. It is undeniable that there do exist some obscene contents on certain TV programs and in some computer games, such as violent and erotic scenes, which might erode some young minds who are susceptible to such information. Whereas this is not the case for all TV programs and electronic games.

However, I would say that we do not need too much apprehension about this trend, while considering the advantages brought in by these two kinds of entertainment. What needs to be pointed out first is the educational function of TV. Comparing with tedious lines in test books, it is those documentaries and educational animations on television that intrigue young inquiring minds, thus disseminating the knowledge of science, history and culture among the next generation.

Also, we should not forget that computer games also have their role to play in stimulating children's interest in learning. Had it not been for some games like Medieval Age or Civilization, many children would have been less likely to explore the history of human civilization, say, the reasons of World War II, the rise and fall of the Third Reich, the stories and anecdotes of those famous historical figures like the Lion Heart.

In conclusion, I would reiterate that there is always a dark side of the moon, television and computer games should be recognized more as practical educational tools and mind openers for young children rather than electronic evils.

观点类 孩子应该被鼓励看电视

Some people believe that children can learn from TV effectively, so children should be encouraged to watch TV regularly both at home and at school. To what extent do you agree or disagree?

范文:

In spite of the fact that the world is undergoing various changes in recent years, education remains one of the most heatedly discussed issues, especially the one related to the appropriate approach of teaching. There are some people who contend that as children can achieve high efficiency in learning through watching television, they should access the TV programme both at home and school. Personally, I completely disagree with this opinion.

First of all, assuming that children can actually learn effectively from TV, which would be doubted subsequently, this will adversely affect children's physical development, by which I mean children should not be persuaded to watch TV regularly both at home and outside. On the one hand, although the topic does not give a clear frequency for the term of regularity, considering that family life and school life almost occupy the whole time of a child, watching TV too often will definitely impair the immature retina of children and eventually lead to pseudomyopia. Meanwhile, in the process of watching TV, children would need to be sedentary, which leads to the lack of outdoor exercises, which is extremely unfavorable to the physical conditions of children.

Admittedly, it is acknowledged that TV education programs, full of vivid pictures and various sound effects, can really attract children. In other words, according to the characteristics of children's psychological development in childhood, they would prefer vivid colors and diverse forms of teaching methods, which may arouse their learning motivation and enthusiasm. However, what should be mentioned here is that the programs on TV are actually diverse, and there are even many programs that are not suitable for children to watch, such as movies involving pornographic and violent plots, or other cartoons that no relationships with instructive meaning. If parents and schools do not effectively screen the selection, watching TV for children is more interference in learning than the effectiveness that suppose to be brought about. Besides, another reason why watching TV should be persuaded is that using TV as a way of learning may substantially undermine children's imagination. To imagine something requires the ability of figure out concertized, that is to say, the more presentative the input is, the more imagination one would be trained to develop. However, once the television gives too much concrete information, it is difficult for children to have the opportunities to exercise imagination, by which I mean too concrete interpretation to the utterance would be seen as the confine of mentality, since conventional thinking would be fostered when one is injected too much with visualized inputs.

In conclusion, it seems to me that watching TV is just a teaching method which is really emerged and children should not be permitted to watch regularly as the effectiveness of this means is quite questionable. Besides, this learning approach should be applied sensitively under the guidance of parents and teachers.

利弊类 让孩子玩电脑或 iPad 来学习科技

More and more parents allow their children to play on computers or tablets (like iPads) because they think that children should learn technology skills. Do the advantages outweigh disadvantages?

范文:

A growing number of parents think it important for children to acquire new technology and therefore allow offspring to play with computer and iPads. Personally, I do not think the practice will achieve its desired result. Rather, I tend to worry more about its side effects on children's all-round development.

Superficially, many parents take it for granted that manipulating electronic gadgets means the acquisition of new technology. From their perspective, it is the technology that dominates almost all aspects of life, whether these be the smart cooker in the kitchen or the iPads that provides almost all answers to the problems in study and work. An early exposure to computers endows children the ability to operate electronic products and the software, both of which is indispensable to their future study and working careers. Taking this point to a further step, the younger generation who are adapted to computers are more likely to be creative thinkers who can seek answers via the Internet, rather than a passive learner who are stick to the traditional views of elders.

Plausible though the argument sounds, I do not reckon the vision as optimistic as many parents have expected. The core issue is that it is over idealistic to equate playing on computers with learning new skills. Instead of obtaining something useful for study or later life, the disappointing fact is that many children are just lost in the rabbit hole of games, latest season of TV shows, not to mention the obscene content containing violent and erotic scenes. As well as the neglect of what children do on the computer, another problem we cannot afford to ignore is the detrimental impacts on children's emotional development: an over indulgence in the virtual world from an early age will inevitably lead to the indifference of many young minds. Such a problem, in the long-term perspective, will become an impediment frustrating the younger generation in the interpersonal relationships in future careers.

In conclusion, early exposure to computers or other smart gadgets might help children be adapted to new technology skills, the possible benefits, however, cannot be to the detriments of children's development in the comprehensive consideration.

范文 2:

It is common to see many children play on a computer or a tablet, which is supported by many parents, because they believe that the early exposure to these devices can shape the technology skills of their children. I think the benefits of this trend outweigh the drawbacks.

The most obvious advantage may be that many computer games enable these young players to nurture a wide range of skills in dealing with computer technology. There are many kinds of educational games now, which would improve children's technology skill unconsciously. For example, in some games, participants should quickly find out virtual enemies, pick up guns and weapons on the ground and shoot at the targets, all of which require players to click keyboard and mouse simultaneously. In the long run, children can know how to manipulate the computer effectively, even being more technologically skillful, which is a very important factor in their future academic study and work.

However, there are also some disadvantages. One of the main concerns is that the time to do physical activities is occupied, which means children usually collapse in front of screen during their spare time rather than doing some exercise. The sedentary lifestyle may lead to some diseases such as obesity. Besides, some games tempt children to continue playing for hours. Thus, children who are addicted would be isolated in the virtual world and lack face-to-face communication, which is harmful to their interpersonal skill. However, tons of games with modern technology which encourage people to do some physical movements are designed and manufactured, such as motion sensing games. In terms of gaming addiction, the government now enact law to restrict the screen time for players under 18, which means a child can play games for only 2 hours a day. In this case, the problems mentioned above would be gradually bettered.

In conclusion, although the problems of the issue should not be ignored, it seems to me that the advantages are more significant.

公众号：雅思情报圈

双边类 孩子玩电脑游戏的利弊

Some people think playing computer games is bad for children on everything. Others think it has some positive effects on the way children develop. Discuss both these views and give your own opinion.

范文:

With the rapid development of society, computer games have become an integral part of people's life, but people hold opposite views on it. Some people argue that computer games have unfavorable influences on all aspects of children, but others believe that playing computer games actually bring benefits to children.

Although the word "everything" is quite extreme, It is hardly far-fetched to imagine just how deeply the situation would negatively impact our next generation, not only in terms of their physical conditions, but of the mentality and personality formation. Healthy problems may be initially be witnessed as in the process of playing children would need to be sedentary, which leads to the lack of outdoor exercises, which is extremely unfavorable to the physical conditions of children. The reality seems even harsher if we consider the following-up consequences brought to these youngsters' personalities. A reckless indulgence in electronic games may easily distort their attitude of facing problems or persons in the real life, by which I mean as it is relatively easy to achieve success in the virtual world, children who are addicted to the game world will gradually refuse to have face-to-face communication with their relatives and friends in the real world. As time goes by, they will be completely isolated.

Nevertheless, with the advances of science and technology industry, the positive impacts of computer games should not be underestimated. On the one hand, virtual world can provide children with multiple and wonderful learning or training modes, where many scenes can never be realized in real life. For example, after a failure or even "death" in the game world, players can read the progress and try repetitively, which can encourage children, who have relatively weaker tolerance to adversity, to have the courage to enjoy the fun of continuous exploration. On the other hand, according to the characteristics of primary students, many teaching software or apps for younger people adopt game mode to attract children's attention, designing interesting and diversified process to maintain children's learning enthusiasm and progress, so that learning is no longer monotonous and boring.

In conclusion, it seems to me that computer games should be treated rationally. For children who lack self-control, we really need parents and teachers to strictly control the content and duration of

the game, so as to reduce the negative impacts of computer games and maximize their positive influences.

公众号：雅思情报圈

观点类 阅读比看电视更能锻炼想象力和语言能力

Reading for pleasure can develop imagination and language skills better than watching TV. To what extent you agree or disagree?

范文 1:

The choice between books and televisions as way of relaxation has long been a contentious discussion with respect to their effect on imagination and language improvement. Despite the approving voice for TVs, I personally hold the view that the benefits of reading outweigh those of watching TV.

The most obvious upside of reading is its value in augmenting readers' imagination. During the reading process, people would construct the whole story in their minds, including the scenes, the appearance of the characters and even some tiny details. This explains why some literature works are reproduced again and again and why movies adapted from best-selling novels, such as Harry Potter, Lord of the Ring, can easily become a hit at the box office: many readers are just eager to check if the director's work of imagination chimes with their own. On the other hand, footage shown in televisions undeniably limits the ways of presenting stories and information.

Admittedly, compared to the obscurity of some words and phrases appearing in poems and proses, TV programmes and documentaries seem to offer a diversified and multi-dimensional enjoyment with more accessible and entertaining verbal language. However, such way of entertainment, such as soap operas, could to a large extent involve superficial input, which is likely to pose limitation in terms of both language upgrading and output capability. In contrary, such restrictions could be alleviated in the process of reading. For example, formal, descriptive and vivid written expressions are more likely to appear in the most excellent books that generally focus on topics with depth, whereas many of the heated films tend to attract the audience through its cinematography, special effects and a starring list.

Conclusively, we have to admit that reading functions as a more valuable leisure activity while sitting in front of TVs appear to provide more shallow happiness.

范文 2:

Amusing reading may be more likely to develop one's imagination than may television watching, but the language skill improvement is hardly to be lumped together as the function of reading.

Those who read for fun frequently would granted be more imaginative in their life than the fans of television watching. Before scrutinizing the reasons behind this, one should first see past the essence

of imagination. For most cases, to imagine something requires the ability of figure out concretized, tangible pictures or contents through relatively abstract formations. That is to say, the more presentative the input is, the more imagination one would be trained to develop. It is therefore reasonable to say that books, with literal information as the dominant medium, are considered more proper to nurture the imagination of individuals, largely due to the necessity of brain-transformation from the abstraction they convey to the configuration in mind, than tv programs, by means of which images and movements are largely involved to materialize information; too concrete interpretation to the utterance would be seen as the confine of mentality, since conventional thinking would be fostered when one is injected too much with visualized inputs.

Whereas it is irrational to state that relaxed reading always brings about more developed language skills than does watching TV. The wide range of linguistic ability, and the multiple needs for it from different people compel the both actions to hardly be compared with one another. Language skills are always widely composed: they include word input and output, meaning whether one can read informal and formal sentences or the logic in chunks and passages, and whether one can write with appropriations under different circumstances; spoken language recognition and expression are also categorized as the skills, meaning whether one can listen and get known the proper utterance others are making, and whether one can explain his own words. While reading only is likely to develop the former skills, the latter can better be gained through visual media watching. However, the claim in this prompt fails to provide certainty about what kind of ability should be acquired by the people, or what kind of people is talked about; therefore, it is irresponsible to over-state the overwhelming function of reading in terms of the language skill development without differentiation.

In conclusion, I would very much agree that effectiveness is manifest for developing one's imagination through relaxing oneself with books more than via watching tv, but whether there would be more improvement of linguistic skills cannot be precisely judged by means of which actions.

双边类 选择喜欢的科目，还是政府决定科目

Some people think that the government should decide which subjects students should study at the university, while others think that students should be allowed to apply for the subject they prefer. Discuss the two views and give your opinion.

范文：

The contradiction between the personal freedom and apprehension about dangers has been a paradox that frustrates us when deciding whether to engage in a sport or not. It looks to me that none of which should be crowned as the golden rule that works with all physical activities regardless of other determinants, and therefore a combination of both freedom of choice and safety concern are needed when choosing to participate in any sports in terms of various conditions.

On the one hand, I think it irrational to ban any sports solely for the reason of safety. The crux of the argument is the ambiguity about the definition of 'dangerous sports' – any physical activities could be reckoned as risky without needed protective measures. There are many sports that might lead to potential risks, such as the boxing or car-racing, but we do not expect them to be prohibited. Rather, if there were clear code of conduct and safety equipment to mitigate the potential harm, the so-called 'dangerous sports' might not be an issue and therefore pointless to be constrained.

On the other hand, it does not make sense to me either that others outweigh personal freedom over other determinants when choosing to participate a sport. I doubt there exists absolute freedom unhindered by other factors; whether these be threats to individual's life or public safety. One of the most controversial examples is the bullfight, which has long been a dilemma featuring the controversy between personal freedom and threat to life, not to mention the violation to the belief of animal right campaigners.

In conclusion, I am convinced that neither of the two opinions is justified enough to illustrate the entire picture of the problem. It will be too simply-minded to ban a sport without the comprehensive evaluation of its risks and possible solutions; so is the freedom principle, which does not work in all conditions. Both arguments deserve their justifications and can be taken as a reference in particular context.

观点类 政府应投更多钱在科学

Some people think that the government should invest more money in teaching science than other subjects to make progress. Do you agree or disagree?

范文:

People hold different views about whether the government should only prioritize science subjects in order to develop and progress. While it is true that focusing on science subjects is conducive to the country, I would argue that other subjects share an equal importance.

On the one hand, science subjects contribute considerably to the advancement of a nation. Firstly, it is evident that various scientific breakthroughs around the world are attributable to knowledge on science subjects such as mathematics, physics and chemistry. Specifically, in the field of medicine, profound knowledge on chemistry enables scientists and researchers to conduct multiple experiments and thus coin new drugs that cure and save thousands lives. Secondly, with the aid of scientific knowledge, students are capable of solving a wide spectrum of real world problems, which in return, cultivates their imagination and creativity. Such capabilities would stimulate innovations that gain the country progress.

However, this does not mean that only science subjects are important. Other subjects like arts, crafts, literature and humanities also play an important role in the overall progress of a nation. These subjects make people aware of their history and culture, which increases the sense of belongings. They also improve our aesthetic skills and enhance the overall quality of our life. Art subjects provide plenty of job opportunities too as well. After all, no nation can progress only on the wings of science.

To conclude, government funding should not be limited to science subjects. For the overall development of the country, the government should support the teaching of other subjects as well.

双边类 学习各类科目还是深入学习较少科目

Some people think that older schoolchildren should learn a wide range of subjects and develop knowledge, while other people think that they should only learn a small number of subjects in detail. Discuss both view and give your own opinion.

范文:

It is sometimes argued that senior school children can study a number of subjects and gain knowledge. I believe that children should receive a rounded education, instead of focusing on several subjects only.

Some people support a broad general education because children can develop a variety of qualities which contribute to their future success. If these children have to study various subjects at a time, they can develop time management skills gradually. They also improve the ability to work in teams when producing works of art with peers in arts classes and doing group sports in PE. These skills and abilities are important to them, when they continue their studies or handle problems of adult life. In contrast, it might be difficult for them to acquire such skills, if they studied some core subjects such as maths only.

On the other hand, students may be more likely to achieve success, if they focus their minds on several subjects only. They do not have to devote time to attending different courses, doing homework of different subjects and preparing for numerous exams. For example, students who intend to practice medicine in the future may spend more time on chemistry, while those who prefer to find employment in engineering can pay closer attention to maths and physics. They can develop expertise and earn higher salaries. In contrast, those who study a great variety of subjects might end up doing some low-paid entry-level jobs.

In my view, studying different subjects is a better option, allowing students to choose their career path more easily. They are not aware of their talents and strengths from an early age, and the experience in different disciplines can help them choose some subjects on which they can spend their whole working lives until they can achieve potential. Some students might not realise that they have artistic talents and can pursue a profession in the design industry, if they did not study the arts. So I strongly believe that students should be exposed to different fields of knowledge.

双边类 学生是否必须学外语

Some people think that all school students should learn a foreign language. Others think that a student should not be required to learn a foreign language if he or she does not have talent for it. Discuss both views and give your opinion

范文:

I would argue in this essay that there is no specific need to compulsorily lead students into the acquisition of the second language, and it is certainly reasonable to set up their curricular system based on their own pros and cons.

The reasonableness of those holding that all school students should be nurtured with second-language acquisition can be easily seen, but it is too absolute to be rationally testified. It is true that once a student accepts modern schooling, they must be with the capabilities of what the society and educational system are requiring, and that is the logic thinking, and some world knowledge, whilst learning a foreign language can properly ensure this gaining, since the semantics and pragmatics of a linguistic system that is totally different from the mother tongue always provide multiple recognitions and thinking modes inside the lobes of one's brain, and that triggers the logic diversification and strengthen this logical ability; cultural influences of foreign languages are also manifest—conventions, livings and exotic visions are somewhat reflected by what is uttered. Whereas the claim is obviously too absolute, since those abilities mentioned, no matter how necessary, are not always gained by all students from just one way. They can expand their visions anyway through their first-languages (there are books and mass media introducing these in their own language), and nurture the logic thinking mode via other subjects like mathematics or geometry; learning a foreign language is certainly not an ultimate and only way leading to this, and it is not supposed to be compulsorily fostered to all those students.

Before scrutinizing whether a student should learn a second-language compulsorily, one must first see that they should not; multiple factors should be considered to make the decision. Among the reasons leading to final goals, necessities and probabilities are testified overall to make a system of differentiation. Giftedness certainly is a decisive element, because it helps contribute to whether it is possible for a student to acquire a skill effectively. When there proves no evidence of students being good at this, it would somewhat be a waste to nurture students for such a long time and for a relatively inadequate outcome with this. Even if the ability of mastering foreign languages can improve certain abilities, they also have to use alternative ways to foster those once they have been testified without good performances because of the lack of talents. Whereas that doesn't mean they should never learn this, but implies that they could consider this as a selection if they somehow have the energy and interests. This type of language education can also be adopted in other subject

schoolings, since it focuses on the personal properties of students, and is a proper way to grade different students with edges of their own.

In conclusion, I would very much agree that learning foreign languages, though mostly necessary, still cannot become the compulsion to force every students to do.

公众号：雅思情报圈

观点类 学生应该花时间去外国学习语言和文化

As part of education, students should spend a period of time studying and living in a different country to learn language and culture. To what extent do you agree or disagree?

范文:

It is argued that students should study abroad to gain both foreign language and culture when they were young. In my opinion, I totally agree with this point of view.

Studying abroad grants students the opportunity to completely immerse themselves in a new language, which can hone their language skills. When living in a new country where everyone speaks another language, there's no way to avoid it. Everything from speaking to locals to ordering food and watching TV will all be done in the local language. In this case, students can pick up on local slang and idioms that people understand and relate to, which are the things that can't learn from a book. Moreover, it is necessary to read loads of study materials in order to fully understand the lectures, which helps students with the vocabulary and grammar.

In addition, I believe that youngsters would obtain the cultural values when they have a real experience in the different country. American author Mark Twain put it best when he said, "Travel is fatal to prejudice, bigotry, and narrow-mindedness." In a world that is more connected than ever, an open-minded appreciation and understanding of other cultures is essential. Not only will living and studying abroad enrich our understanding of different people and customs, we will also gain a broader context for understanding today's most pressing global issues. From peers to professors, learning in an international environment will challenge our assumptions and introduce us to new ways of thinking about the world.

In conclusion, I would argue that studying and living in a foreign country brings lots of benefits for young people in both language capacity and cultural values.

公众号：雅思情报圈

范文 2:

While there has long been a controversy over whether it is necessary for students to further their study abroad in order to learn the language and culture of a nation, I tend to say that studying in other countries should not be recognized as a compulsory option in linguistic and cultural learning.

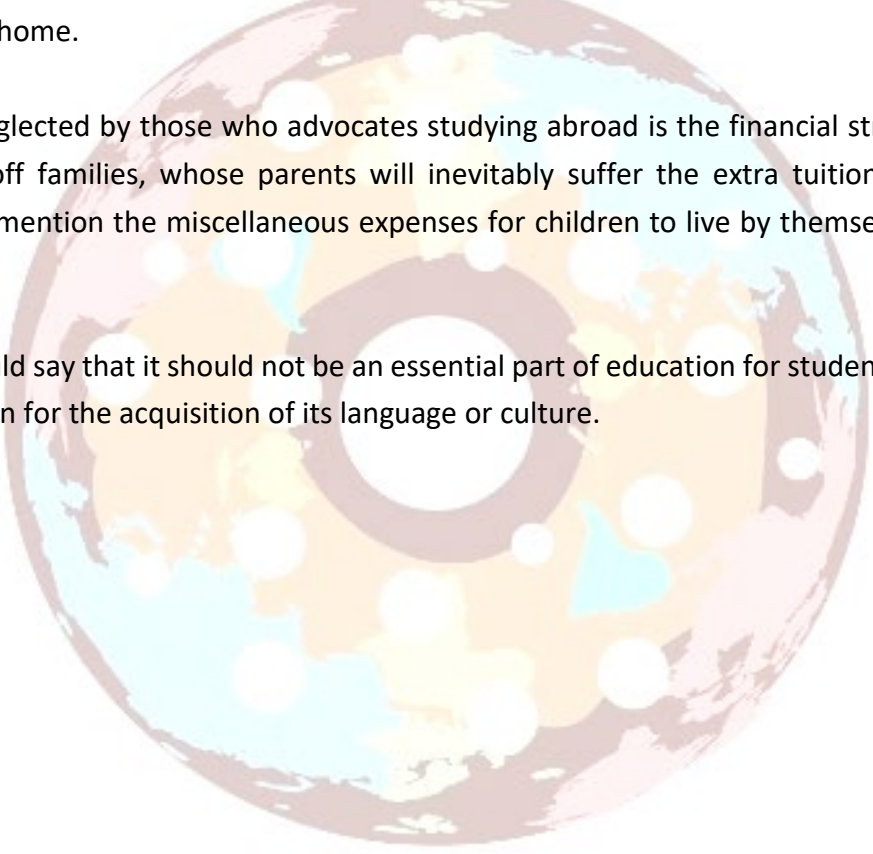

Traditionally speaking, a firsthand overseas experience is usually reckoned as indispensable to manipulate a foreign language and the culture behind. Living in an increasing trend of globalization, the younger generation today is more involved in the exchange and clash between different cultures. In response to this, to step out of their own countries seems to be a straightforward choice for those

who want to pick up a foreign language while experiencing the indigenous lifestyle and tradition on a daily basis.

Plausible though it seems, however, I would say that the Internet today has allowed us an alternative way to communicate with the world outside, rather than physically attending a lecture at the other end of the globe. The world today is moving in a direction where countries are glued by computers and cables instead of ships and flights as it used to be, which means that modern international students do not have to necessarily sail thousands of miles away as their predecessors did. In contrast, with a swipe on screens, youngsters nowadays can access global educational resources online without leaving home.

Also, what is neglected by those who advocates studying abroad is the financial stress on students from less well-off families, whose parents will inevitably suffer the extra tuition fee in another country, not to mention the miscellaneous expenses for children to live by themselves in a foreign land.

Given this, I would say that it should not be an essential part of education for students to visit another country in person for the acquisition of its language or culture.

公众号：雅思情报圈

观点类 艺术课程应成为高中必修课吗

Art classes, like painting and drawing, are not as important as other subjects, so some people think that it should not be a compulsory subject at high school. To what extent do you agree or disagree?

范文:

Art classes are regarded to be less important than other academic subjects and should not be compulsory in high school. But in my opinion, it is still essential to include art classes such as painting and drawing as part of high school curriculum.

Art-related courses are of benefits to students' academic learning and future career. Studying art course can be a stress-reducer, which helps them to face academic challenges more energetically. As most students are now overburdened with the over-testing and fed up with the study, they can be in their own world and create a peaceful mind when they are painting and drawing. In addition, painting and drawing can encourage students' imagination, creativity and aesthetic appreciation, all of which are skills needed if students want to be engaged in creative industries like being fashionable designers or architects in the future.

Those who hold the opposite view think that introducing paintings and drawings to the curriculum of high school will occupy a lot of time which should be spent on academic learning. Meanwhile, some even argue that this practice may put more pressure on students. What I want to refute, however, is that teachers can arrange a reasonable schedule and find other forms instead of the old paper examination to test the results of art learning such as painting a picture.

In conclusion, art classes need to be considered as a course in high school. The purpose of education is not just to help students acquire basic academic skills, but also encourage their all-around development.

公众号：雅思情报圈

双边类 中学生学习国际新闻是浪费时间？

It is believed that secondary school children should study international news as one of their school subjects. Others think that this is a waste of valuable school time. Discuss both views and give your opinions.

范文：

International events can have an impact on our lives, so it is important to encourage middle school students to pay close attention to international news. Despite the importance of reading news, I believe that schools should not run this class.

Some people argue that if students are familiar with current affairs in the world, they can adapt to the globalised world easily. International news enables them to keep up to date with what is happening in different areas of knowledge such as artificial intelligence, genetic engineering and renewable energy sources, so it will be easier for them to explore business opportunities in these fields in the future. Apart from this, they can gain information about economic events by watching or reading international news, and make well-informed investment decisions and use money wisely.

However, some educationalists are opposed to this move, because they think international news can interfere with students' studies. Students have been overloaded with homework or revision in core subjects such as maths, chemistry, literature and physics, so they are unable to devote time to a new course. In other words, once international news is incorporated into the curriculum, this may distract them from these key disciplines and even have an adverse impact on their academic performance. This is particularly the case for students who do not have time management skills.

In my view, news reports on international events sometimes contain political bias, and children should not spend their valuable time studying this subject. Many news organisations are normally run by the government in many countries, and the coverage of international issues in these outlets tends to give an inaccurate or unbalanced account of some cultures or countries. Rioting and social unrest in some African countries, for example, has been a popular subject of many news reports, giving a false impression that these countries are not suitable for investment. Gun violence in some cities has also been exaggerated and children who are exposed to such news may not choose to work or live in these cities in the future.

双边类 学历史还是其他课程对孩子成长更有帮助

Some people think it is important for all children to learn history at school. Others believe that other subjects are more relevant to children's development today. Discuss both views and give your opinion?

范文:

It has long been an assertion that history should be a compulsory subject, whereas many schools nowadays give priority to the more practical courses like computer and bio-engineering. It looks to me that none of which should be crowned as the golden rule that works with all students regardless of other considerations, and both views have their justification in terms of various conditions.

On the one hand, I reckon it irrational to take it for granted that all students should learn history. Some might argue the history plays as the guide for the younger generation to learn what has been justified as right and therefore to gain insight into their future careers. Nevertheless, that does not mean it works with all youngsters: not everyone has the aptitude for remembering hundreds of historical events as well as their influences, neither do the schedules of all classes allow for extra time for a course that might distract students' focus on their core subjects.

On the other hand, it does not make sense to me either that other subjects necessarily eclipse history in this world dominated by technology. To the utilitarians, the modern school is nothing more than an incubator of skilled workers, whether these be computer programmers, IT engineers or webpage designers, who are more likely to receive offers from a red-hot company. Unfortunately, what is ignored by those pragmatists is a common feature in many business or political titans in the human history – they all have a mind open to all kinds of knowledge, rather than limited to their own professions; in many cases it is the study of history that direct them the future of a company or an empire.

In conclusion, I am convinced that neither of the two opinions is justified enough to illustrate the entire picture. It is too simply-minded to oblige every student to learn history; so is the opponents who prioritize the scientific course, which is also based on shallow definition of children's development. Both arguments deserve their justifications and can be taken as a reference in particular context.

双边类 中学全面教学 VS 个别领域教学

In some countries, secondary schools aim to provide a general education across a wide range of subjects, while in others, children focus on a narrow range of subjects related to particular careers. Which education systems is more appropriate for today's world?

范文:

Some people assert that countries should focus exclusively on developing economy so as to eliminate poverty, whereas other believe that the development leads to environmental problems and therefore should be suspended. It looks to me that it is only a question of different emphasis: both views have their justifications depending on the need of different countries.

On the one hand, it does make sense that impoverished countries should prioritize the boom in the economy over its implications on the ecosystem. From the perspective of the advocates of this, the very problem that exhaust these nations is not the habitat of flora and fauna but the backward economy, whether these be low productivity in farming, insufficient investment in infrastructures, or the millions of deaths due to hunger and diseases. Considering this, stimulating economic growth is crowned to be of paramount importance in providing the funds to tackle these problems. One convincing example is China, where the roaring economic rise during the past half century has witnessed a dramatic decrease in its poor population and the elimination of famines.

While the argument has its role to play in less developed regions, it is not justified enough to silence those environmentalists protesting in the streets in industrialized countries, who have already experienced the detrimental ramifications coupled with the economic rewards. In America, for example, it is the popularity of private cars that has become the major culprit for the increase of carbon dioxide. Also, the cost to address the pernicious impacts of some industrial projects might overwhelmingly outweigh their contribution to the tax system, considering the long-term soil erosion and contamination of river due to the hazardous pollution – this concern from an economic perspective also begets the claim that the flourishing should not be at the sacrifice of environment.

In conclusion, each statement has its justification from certain perspective, I would say that emerging economies could draw lessons from the industrialized countries in their experiences in dealing with the relationship between development and ecological system, and therefore initiate a more comprehensive strategy that meet their demand.

双边类 根据学生能力进行挑选并教学

Some people think that schools should select their pupils according to their academic ability. Others believe that young people with different abilities should be educated together. Discuss both sides and give your opinion.

范文:

Different people have contrasting views on whether the pupils should be streamed in the school. As far as I am concerned, mixed ability classes can be a more reasonable educational approach despite some benefits in the streaming way.

Proponents of dividing children with academic performance often argue that selection takes individual differences into a thorough consideration and thus schools can provide specific objective to meet pupils' personal needs. After all, each child has his or her distinctiveness in terms of learning preferences, personalities, interests, and so forth. Through selecting and separating the youth into different classes based on their talents and intelligence, for instance, schools are able to not only tailor a result-oriented syllabus to explore each student's maximum potentials but also minimise the possible peer pressure that some slow learners suffer from the negative psychological impacts considering the poor performance they have in exams or assignments.

On the other hand, those who are in favour of mixed ability classes attach great importance to the contribution of healthy competitions. In spite of the possible imbalance between each student's academic performance in a class, superior peers could serve as a desirable role model to others. Their strengths, such as learning attitudes and methods, could enlighten the rest of the class to improve and endeavour in study. Besides, the diversity in class can promote the mutual study among children with different abilities and create a better environment for children's all-round development.

In my opinion, although the teaching resources could be assigned more efficiently to target youngsters' gifts in the streaming, it is still too early and unfair at this stage. Influenced by the misconception of classifying with abilities, children might be misled to overestimate their talents or underestimate their potentials. A dynamic and harmonious class, in contrast, shares more similarities with the real society and presents them chances to learn how to appreciate others' fortes and embrace others' weaknesses.

双边类 集中教学还是分层教学

Some people think that teaching children of different abilities together can benefit everybody, while others think that intelligent children should be taught separately and given special treatment. Discuss both views and give your opinion.

范文:

The approaches of receiving education in school is always the concern of many educationalists. A lot of individuals still support the traditional big-class teaching, while others hold the view that the targeted special care should be given to those high-achievers in school.

On the one hand, those who are in favour of mixed ability classes attach great importance to the contribution of healthy competitions. In spite of the possible imbalance between each student's academic performance in a class, superior peers could serve as a desirable role model to others. Their strengths, such as learning attitudes and methods, could enlighten the rest of the class to improve and endeavor in study. Besides, the diversity in class can promote the mutual study among children with different abilities and create a better environment for children's all-round development.

On the other hand, there are concerns that those highly competent learners deserve some tailored treatment in the separated class as schools can provide specific objective to meet pupils' personal needs. After all, each child has his or her distinctiveness in terms of learning preferences, personalities, interests, and so forth. Through selecting and separating the youth into different classes based on their talents and intelligence, for instance, schools are able to not only tailor a result-oriented syllabus to explore each student's maximum potentials but also minimise the possible peer pressure that some slow learners suffer from the negative psychological impacts considering the poor performance they have in exams or assignments.

From my perspective, I believe the practice of streaming the children should take the age into consideration. Although the teaching resources could be assigned more efficiently to target children's gifts in the streaming, it is still too early and unfair at the primary school stage. Influenced by the misconception of classifying with abilities, pupils might be misled to overestimate their talents or underestimate their potentials. It is more appropriate to divide the students academically from the secondary school stage considering their enormous potential to develop their talents in primary stage and the extent of their psychological maturity in secondary stage.

双边类 学校所教内容是否有用

Some people claim that many things that children are taught at school are a waste of time. Other people argue that everything study at school are useful at some time. Discuss both views and give your own opinion.

范文:

People take different attitudes towards the usefulness of school education. While some people regard it a waste of time to study at school, I would agree with the opponents who believe that everything imparted by academic institutions have their justification.

Admittedly, it is easy to understand why some young individuals are disappointed about the results of schooling, particularly for those pragmatists who look forward to immediate rewards from anything they have done. There do exist some businesses where the theoretical proficiency is eclipsed by empirical knowledge. Let's imagine a hypothetical situation where two candidates compete for a position of car dealer or estate agent. Supposing that one applicant has just graduated from university while the other is a senior sales person without degree, the former would have less odds to win out.

However, I choose to stand by those who believe that every course is worth learning, whereas it is just a matter of time for the knowledge to shine a light. Living in a rapid-changing era, few people can anticipate the future trend of the market, meaning that anything we learn, though it might not benefit us at the moment, will have its role to play in our future careers - what the world needs in the future will not be skilled worker anymore but more versatile talents who can switch between different roles using diversified knowledge. By contrast, those utilitarians who overlook the importance of study will be justified to be myopic and inevitably be left behind the new wave of business. One convincing example is the success of Woody Allen, the famous movie director. Were it not for those seemingly useless knowledge of history, literature, music and art, which he has accumulated for the past of life, he would have not been able to tell so many fantastic stories in his movies.

In conclusion, academic education might seem time-wasting to those short-sighted people, I believe that study will be one of the most rewarded thing we ought to do.

观点类 国际交换项目对所有青少年都好

Some educationalists think that a programme of international exchange visits is beneficial to all teenager school students. To what extent do you agree or disagree?

范文:

International exchanges has penetrated into various aspects of the current world, including education. Some people hold the opinion that the exchange programme can benefit all school students. From my view, I cannot agree.

It has to be admitted that there are several advantages of living or studying in a foreign country for certain period of time. Firstly, students who have this experience may be more independent. To be more specific, these teenagers have to take good care of themselves since their parents would not provide assistance when they are in need. Apart from this, when visiting other countries, these teenagers can acquaint themselves with the local culture and society in person, which is much more vivid than acquiring this knowledge from textbooks or videos.

However, it is not reasonable to deem that it all students could be benefited. Firstly, for those students who come from an unprivileged family, the cost of the international exchange might be hard to bear. These disadvantaged families may have troubles in paying the bills or other daily necessities, so it would be a huge financial burden for these families to afford. Besides, most teenagers are characterised by immaturity and naivety, which means that they are not fully equipped with the ability to distinguish the right from the wrong. In this case, if they are exposed to inappropriate circumstances and materials without being informed the proper guidance from their parents, they may be influenced by indecent people or information.

To sum up, I believe that teenagers could be encouraged to join in the international exchange programmes, but it may not be a proper choice to require all students to be a part of it.

公众号：雅思情报圈

观点类 大学生参与其他活动

Full-time university students need to spend a lot of time studying, but it is essential to involve other activities. To what extent do you agree or disagree?

范文:

In spite of the fact that the world is undergoing various changes in recent years, education remains one of the most heatedly discussed issues. There are some people who argue that participating extra-curriculum activities also plays a crucial role in the life of full-time college students. Personally, I partially agree with this idea as these activities do bring numerous benefits to university students.

First of all, social activities, such as volunteering or internship, strengthen student's ties to the community and broadens their social network by exposing them to people with common interests. This is so because being engaged in these activities gives students opportunities to practice important skills such as teamwork, problem-solving and interpersonal skills, which can be regarded as a must when companies recruit employees but cannot be gained in daily academic learning. Besides, other extracurricular activities related to hobbies or interests can also improve the basic quality of students. For example, engaging in sports have a positive effect on students' overall psychological well-being and helps to combat sedentary lifestyle caused by long-time learning. Therefore, getting involved in other activities enables university students to associate their academic knowledge with practical experience and meanwhile promotes a healthier lifestyle.

Admittedly, university students should spend enough time on studying so that they can better learn the theories and skills that will form the basis of their entire professional career. Considering the heavy pressure of trying to have a good command of knowledge, some students, especially who are full-time study, have already been overloaded with piles of reading materials and assignments. However, good academic performance is not solely determined by the time devoted to learning, not to mention that it is difficult to quantify the exact amount of the time spent on studying. It would be better if students can reconcile their study with extra-curricular activities, which may help students release the mounting pressure suffered from monotonous learning.

In conclusion, it seems to me that taking part in social activities does bring enormous benefits to university students, which also meets the need of well-rounded development. Essentially, making studying monotonous contradicts key aspects of what we know about learning.

观点类 大学生应专注一个科目还是广泛接触好？

Students in university education should develop specialist in one subject area rather than develop wider range of different subjects. To what extent do you agree or disagree?

范文：

In modern-day society, university has long been viewed as the palace of knowledge where students are encouraged to learn and explore. Some argue that students had better pay their attention to one area rather than scatter their focus on different subjects; however, I wholeheartedly disagree with this proposition.

It is wrong to believe specializing on only one subject is beneficial to students. Some claim otherwise because they believe full dedication to one area may contribute to students' future career success by providing them more employable skills. However, it is my belief that students doing research in one area may lack of a full view, which is fairly important to their work. In fact, almost all subjects are inextricably linked; knowledge accumulated on only one branch will restrict the development of their thinking pattern.

Moreover, learning different subjects can also generate a number of benefits chief among them enabling students to be more knowledgeable. For example, it is common that students often pick up some selective courses, such as Astronomy or Archeology in university, which not only ignites their curiosity towards the world, but also makes them more charming and funny because they often can have things talking about with their friends. In addition, university students can be more competitive in the graduate job market if they have a track record of learning other subjects because possessing various types of skills may help them win in this intensive world; otherwise, a weaker storage of knowledge often narrows their career path.

In conclusion, there is no question that university students should be motivated to learn a wider range of subjects due to the merits in helping students form an overall view and developing their outlook and competitiveness.

观点类 年轻人是上大学还是去技校学习

Too much emphasis has been put on going to university for academic study. We should encourage more people to receive vocational training because of the needs for tradespeople like plumbers and electricians. To what extent do you agree or disagree?

范文:

It is true that society always needs a skilled workforce to function. Employees of different professions contribute differently to the thriving of the community, and therefore I disagree with the statement that vocational courses should be given any more weight than before.

The fact that many people deem it more important to take tertiary education than a vocational training program has resulted in a shortage of qualified workers. It is universally accepted that knowledge and qualifications gained from university can help one to have a head start over other candidates when it comes to job hunting. In China, for instance, a majority of high school graduates are content to spend four to five years more studying at a university with the hope for a bright career ahead. This results in a lack of skilled manual workers such as plumbers and electricians in society.

However, if we encourage more people to become blue-collar workers, then there will be a shortage of white-collar workers who may otherwise create more wealth for society. For example, fewer engineers would mean lower productivity; a dearth of scientists may inhibit scientific discoveries which can provide us with a better life in the future. In contrast, those doing blue-collar jobs may face redundancy when too many applicants compete for the same position. An unbalanced workforce might, therefore, hold society back from development in the long term.

In conclusion, the workforce will adjust itself to cater for the need of the community, so there is no need to direct young people to follow a particular career path.

范文 2:

In recent decades, it has become almost required for young people to go onto higher education at universities. However, although it has long been a government objective to reach the current level of university attendance, there is a school of thought which says that the government is now educating too many young people to degree level and that those same youngsters in the job market, would be better promoted by a greater focus on vocational training.

Admittedly, some students are clearly suited to the academic route of a university degree, and if they have a particular career in mind which demands this level of qualification, then they should

receive every encouragement to follow their chosen path. After all, the university offers an academic experience, with broad knowledge and basic skills to serve as the foundation for further learning and on-the-job training. However, some suspect that an academic education explores the theoretical and hypothetical, but is not necessarily practical, realistic or directly useful.

Therefore, it seems to me that for some of students, vocational training might be a better options. First of all, vocational training has a distinctly different educational focus as it is aimed at delivering practical, job specific skills, and by pursuing a technical-vocational education, different levels of courses should teach students the specialized and practical job-related knowledge and skills they need to know to perform a particular job role. Besides, learners are often more in-line with the job market needs leading to increasing employment. For example, in some Latin American countries, data show that at least in the graduate's first years, technical graduates usually have better employment opportunities than university graduates, especially in the context of recent economic reactivation .

In conclusion, with inconclusive results over which type of education is better for lifetime success, I think much of it comes down to personal choice, career aspirations, and talent. However, we cannot ignore a fact that employers are increasingly requesting a greater element of vocational training be introduced alongside academic studies.

双边类 去大学学习还是积累工作经验

Some people believe that studying at a college or university is the best way students to prepare for their future career. Others think they should leave school as soon as possible to develop their career through work experience. Discuss both views and give your own opinion.

范文:

As a vital choice in people's whole life, the topic of how to achieve career success is of great concern for many people. Some people argue that acquiring knowledge is the most feasible means to make the preparation for the further career whereas others contend that working experience is more crucial. Personally, I prefer the former.

First of all, universities are the temple of learning, whose sole objective is to provide the depth knowledge, especially for those who are preoccupied with scientific researches and technique innovation. In other words, students can access the library and latest journals, be tutored directly by the professionals who are specialized in the relative fields, and facilitated by the advanced equipment sponsored by the government. Besides, the academic qualifications of renowned schools and universities can be regarded as a prerequisite of obtaining jobs of fortune five hundred enterprises, and help students establish essential network of references to adapt to the new career life.

Besides, even for those who choose to study in vocational colleges, study should be regarded as the priority. A user can make best use of a machine or device if he knows detailed capabilities. Therefore, it is essential to learn theory before jumping into practicals. For example, it is admittedly that it is not hard to become a cook, but if one wants to become an exceptional chef, he has to acquaint himself with the knowledge related to chemistry, nutrition and even designing in order to create his own specialist. Otherwise he can only be a general cook and suffer from the backbreaking tasks repetitively with low pay.

Theoretically, some domains do require adequate working experience to guarantee the job promotion. For example, in terms of the field of marketing which varies substantially on the basis of different cultures, customers preference and current affairs, being a successful salesman means to have a deep and comprehensive understanding of the market, which is acquired by the accumulation of long-term work experience rather than reading academic books in the universities. However, facing the soaring population and fierce competition, without a college degree most of the people cannot be recruited as a salesman, not to mention the further career development.

In conclusion, it seems to me that although some occupations require working experience, I am still firmly convinced of that studying first is the best way to make preparation for the further career as

universities both as well as college can provide the latest knowledge and skills for students to cope with the subsequent challenges.

教育类 更多人想去读大学

More and more people want to study at university, so competition for university places is increasing. Why do more and more people want to study at university? Is it a positive or negative development?

范文:

In China, with the expansion of university enrollment, a growing number of candidates can access the right of acquiring knowledge in universities. Accordingly, more and more families also regard going to university as one of the most crucial aim in their life. It seems to me that the increasingly fierce competition in the workplace and the fairness of education are two reasons for this tendency.

The first reason why increasing people choose university education is largely due to the fierce professional competition. This is so because with the popularization of university education, the university qualification has become a prerequisite for getting a job. On the contrary, although the employment rate of vocational workers is relatively high, it is generally for them to receive lower social status and income, compared with the graduates with university degree. Besides, currently, further study has become a must when pursuing the occupations with higher salaries, but university degree has become the cornerstone of higher education. The second reason lies in the gradual equity of education in some countries. For example, in China, the income of people in rural areas and regional areas is generally low, but with the comprehensive popularization of nine-year compulsory education and the further increase of education investment, the opportunity to attend college entrance examination has become an essential means for these children to change their fate. At the same time, China has also set up grants and student loans to facilitate children to have access to the refined education in universities.

Personally, I believe that despite enormous benefits brought about by this tendency, the detrimental impacts are also very obvious. First of all, the soaring number of college students directly leads to the uneven distribution of human resources in the society. On the one hand, the number of talents in some popular majors, such as finance, business, computer and so on, has soared, resulting in fierce competition in these industries. However, due to the relatively limited number of jobs, some talents have been wasted; on the other hand, the extreme lack of professional technicians limits the healthy development of these industries to a certain extent. In addition, the surge in the number of college students has also caused the shortage of educational resources to a certain extent. In other words, the teacher resources, buildings and dormitories of the university itself need to be increased or expanded. Meanwhile, theoretically, as an important scientific research institution, with the increase of student staff and research projects, the investment in scientific research will also increase. However, under the global epidemic environment, the medical advances will continuously increase,

by which I mean most governments in the world now will take the treatment of coronavirus and the popularization of vaccine as the priority, while the investment in education will be relatively insufficient.

To sum up, in my opinion, more and more people focus on going to university, which has a lot of negative effects, mainly because of the imbalance of human resources and the shortage of educational resources.

公众号：雅思情报圈

双边类 更多大学生对国家有利

Some people believe that a country would benefit a lot from a large number of young people entering universities; however, others think that the large amount of people receiving the education of university only leads to graduates' unemployment. Discuss both views and give your own opinion.

范文

People have different views about whether the universalization of tertiary education is a desirable trend. Although the increase in the number of university graduates would inevitably intensify the competition in the job market, I believe that a larger proportion of the population owning an undergraduate degree can greatly benefit a country in the long run.

On the one hand, it is undeniable that a large proportion of people owning an undergraduate degree may lead to problems related to employment. If considerable numbers of people leave school or university at the same time, there will be intense competition for jobs. This oversupply of labor could cause an increase in unemployment, or lead to poorer working conditions as employers realize that they can bring wages down and exploit young workers. Another possible consequence might be that young adults are forced to migrate abroad in search of work.

On the other hand, the universalization of tertiary education leads to long-term benefits that nothing else can have. Firstly, a larger number of well-educated young workers usually means advanced science and technology, which brings the country wealth and higher status in the world. Secondly, a higher average educational level can help build a more stable society with lower rates of poverty or crime so that the country can function better as a whole. Finally, more young adults, no matter born into rich or poor families, all having a chance to accept university education can make children more motivated and society more vibrant.

In conclusion, although there are drawbacks to having too many university students, I support the view that a country is highly likely to benefit from a higher percentage of its population accepting college education.

观点类 大学该不该为偏远地区学生降低标准

Students from poor backgrounds such as rural areas often find it difficult to gain access to university education, so people think universities should make it especially easy for them to study at. To what extent do you agree or disagree?

范文:

It is true that students from less developed areas has more difficulty in entering university, which leads to an opinion that the academic institutions should lower the entrance requirement for these applicants, allowing them an easy access to tertiary education. This suggestion might benefit certain groups of students, though, I do not think that increasing the opportunity of higher education has to be at the sacrifice of the scholastic principal.

It is easy to understand why it is argued that students from impoverished areas deserve preferential treatment in the entrance examination to universities. To the advocates of this, they take it for granted that students from regions of underdevelopment are academically inferior to their counterparts in more affluent areas, given the fact that the majority of prestigious schools are concentrated in urban areas. In response to this, to lower the entry threshold for such students could ease their academic shortage and therefore increase their possibility of passing the entrance exam.

Plausible though the argument sounds, I would say that it is irrational to bestow a privilege to certain students to the inequality of others. It is a fallacy that students at a disadvantage should be treated with different standard in competition. To take Olympic games for reference, despite the imbalance between rich and poor countries in their resources in sports, we do not expect to have different judgement criterion based on where the players come from. As well as the rationality, another problem we cannot afford to ignore is the that such a practice would undermine the educational quality: an easy access means some academically unqualified applicants will be given the offer to study the courses that are beyond their capability; I doubt the professionalism and prospects of these graduates.

In conclusion, I am convinced that it is absurd for universities to lower the scholastic requirement of entrance to accommodate less advantaged students.

利弊类 大学远程培训利弊分析

Universities and colleges are now offering qualifications through distance learning from the Internet rather than teachers in the classroom. Do you think the advantages of this outweigh the disadvantages?

范文:

Despite the fact that the world is undergoing various changes, education remains one of the most heatedly discussed issues, especially with the advent of online education. Moreover, there even exist some people who argue that human teachers can actually be replaced by distance learning available on the Internet. Personally, I believe that human teachers are irreplaceable.

First of all, actual teachers are more flexible compared with their virtual counterparts in terms of teaching. After all, computers can only work based upon the programs set by human beings, which means only repetitive work can be undertaken by computers. On the contrary, teachers are able to adjust their teaching plans to cater for the needs of different students.

The second advantage of human teachers is that exchanges of emotions and feelings between students and teachers can be realized more efficiently through face-to-face communication. In fact, apart from imparting knowledge, it is also the responsibility of the teachers to encourage and inspire students by sharing their own life experience. Therefore, not only can teachers play the role of knowledge base, but they can also serve as role models who guide students throughout their lives.

Admittedly, distance learning from the Internet can also be an option despite its obvious disadvantages. One of the benefits might be the considerable amount of information available online as well as the easier access. After all, studying by a computer is more time-efficient and cost-efficient in comparison with studying in the actual classrooms since commuting can be avoided.

To sum up, in spite of the huge amount of information as well as the obvious easy access of distance learning, I am still convinced of the benefits of human teachers mainly because of the flexibility and the emotional exchanges which are made possible by talking face-to-face.

观点类 传统面授课是否仍被需要

Lectures were used in the past as an old way of teaching a large number of students. As new technology is now available for education, some people suggest that there is no justification for lectures. To what extent do you agree or disagree?

范文:

The Internet has penetrated in every student's educational process. However, to most students, if they are unable to get access to the guidance of a qualified teacher as well as the virtual world, they would be at a disadvantage in terms of studying. Therefore, schools will continue to be an indispensable part of the education in a long term.

For a majority of students, obtaining knowledge from the Internet is not easier than it might seem. If they are unaware of how to distinguish the valid data from all information online, their learning efficiency would be influenced to some degree. As a result, they will find it difficult to accomplish the study objectives, pass examinations, and may even graduate with low scores. Therefore students need guidance from teachers to help them in time and this can be provided much more easily with face-to-face communication.

Furthermore, distance education is an ineffective way to cultivate students' interpersonal skills which they can get in a brick and mortar school. Students complete their tasks independently without opportunities to socialize with their peers, a consequence that they are less likely to build up a network of contacts, which may exert an adverse impact on their future career development. By contrast, those who learn from lectures at school can do a wide range of activities on campus such as playing sports and engaging in clubs. These experiences encourage them to build close social relationships.

In some cases, studying online may offer a perfect solution for some students, especially those who cannot afford to attend a good university, or need to study part-time. Under this circumstance, the Internet may be an acceptable alternative as it is much more flexible in comparison with schools' lectures. Most high quality educational resources can be acquired easily and freely without geographical barriers as well as time limitation. The real situation, however, is that these sorts of students only occupy a small proportion and online studying is not the mainstream in educational domain.

In conclusion, although a certain number of students do produce satisfying results from online courses, the majority still need the guidance that schools provide to achieve a better performance. Therefore lectures will continue to be an essential teaching method in the future.

利弊类 从网络获取信息知识的利弊

In the past, people stored knowledge in the books. However, nowadays people store knowledge on the internet. Do you think the advantages of this outweigh its disadvantages?

范文:

Internet technology is updating all aspects of people's life, especially means of information storage. There have been mixed responses to this development, and personally I think the benefits of storing knowledge on the Internet outweigh its drawbacks.

Admittedly, many people simply prefer reading real books for knowledge to online sources, because they believe books are more reliable and they find themselves emotionally and intellectually more attached to knowledge in books.

However, storing knowledge on the Internet has obvious advantages. Due to its virtually unlimited capacity, the Internet can store all knowledge in the world. This makes it quite unnecessary for us to spend much money constructing the brick-and-mortar libraries. Furthermore, as long as we have Internet connection, we can find whatever we desire to know no matter where we are. Consequently, rather than carrying heavy books with us, we can have immediate access to any book in the world with a few simple keyboard clicks.

In addition, knowledge can be kept by multimedia means in forms of videos, audios, pictures and words. Compared with paper books which can only store words and pictures, electronic knowledge delivered by videos and audio can easily leave people more vivid impression, hence enhancing people's learning efficiency. This is the reason why multimedia classrooms are rather prevalent in schools nowadays.

As has been mentioned above, it is not difficult to draw a conclusion that knowledge will increasingly find its way to the Internet and it will make knowledge storage more economical, convenient and vivid, yet books will never vanish as there are always people who would like to embrace knowledge in printed form.

双边类 远程学习和面授的对比

Some people believe that distance learning from the Internet is more convenient, while others believe that learning through teachers in the classroom is better. Discuss both views and give your own opinion.

范文:

People's opinions differ as to whether it is better to study online or in an offline class. While being physically present in a classroom brings a range of benefits that distance learning cannot offer, I would argue that the convenience of online learning is even more significant.

The most important privilege students engaged in offline lessons have is direct interaction. Students have the opportunity to communicate face-to-face with their teachers without having to suffer from problems caused by poor internet connection. Similarly, students who study offline can come into direct contact with each other, and this could have a positive impact on peer support, discussion and exchange of ideas. For example, whereas online learners are restricted to chatting through website forum areas, students on traditional courses can attend seminars and even discuss their subjects over coffee after lessons. These learners may also benefit from the motivation and element of competition that face-to-face group work brings.

Despite the arguments mentioned above, I believe that online courses are a positive and promising development for various reasons. Firstly, they allow learners to study in a flexible way, meaning that they can work whenever and wherever convenient, and they can cover the material at their own pace. Secondly, the cost of education can be greatly reduced, while revenues for institutions may increase as more students can be taught. Finally, online learning offers open access to anybody who is willing to study, regardless of age, location, ability and background. For example, someone living in a remote area with poor education resources can now enrol on an online course in a different country, which would have been impossible in the days before Internet-based education.

In conclusion, it is my opinion that online distance learning is a more attractive option.

观点类 学生过于依赖老师讲课学习

Students at schools and universities learn far more from lessons with teachers than from other resources (such as the Internet and television). To what extent do you agree or disagree?

范文:

There is an assumption that students learning far more from teacher instruction rather than from independent study options such as internet or television. However, I would disagree with this opinion.

It is not difficult to understand why learning from teachers is recognized as the superior model. For those who think this way, one of the overriding concerns is their students' lack of self-motivation and self-discipline. They believe it is these problems that necessitate teachers' supervision, meaning that students are less likely to be distracted in a classroom than in the digital learning environment. Adding to their point is the value of instructors' intervention; whether it be personalized comment or implications gathered from homework, advice of more effective learning methods or encouragement when students feel frustrated, none of which can be obtained by watching course videos.

Though mentored education does have its role to play in schooling, it is not justified to say that this model overwhelmingly outweighs its digital equivalents. The advocates of personalized instruction seem, in my opinion, to be oblivious to a key fallacy – the term 'far more' is an unquantifiable descriptor. I cannot find any scientific measuring method or authoritative statistical standard to quantify how much more information students acquire from teachers than from digital settings. At this point, it doesn't make sense to me to venerate guided education over digital model; rather, the internet and television, with their employment of artificial intelligence and their unlimited academic resources, appears to be making teachers obsolete in recent years.

In conclusion, it is my opinion that it is illogical to assume instructors as the more dominant source of learning over digital media.

观点类 老师的作用

Some said teachers' main role is to transmit the information. Nowadays students are exposed to many kinds of information, so the role of the teacher will not work in modern life education. Do you agree or disagree with this opinion?

范文:

Despite the fact that the world is undergoing various changes, education remains one of the most heatedly discussed issues, especially with the advent of Internet. Moreover, there even exist some people who argue that teachers may actually be useless in the future because some people believe that the only role of teachers is to instill knowledge and students are in the exposure of abundant information through the Internet since childhood. Personally, I believe that teachers are irreplaceable.

First of all, those who support this idea don't really know what a teacher means. In fact, the functions of teachers are diversified. For example, compared with online learning, the exchanges of emotions and feelings between students and teachers can be realized efficiently through face-to-face communication. In fact, apart from imparting knowledge, it is also the responsibility of the teachers to encourage and inspire students by sharing their own life experience. Therefore, not only can teachers play the role of knowledge base, but they can also serve as role models who guide students throughout their lives.

Moreover, during autonomous learning, the teachers' role should not be ignored. Currently, although people have entered an era of information explosion, it is interesting to notice that knowledge level of general people has not been qualitatively enhanced, and the reason behind is quite simple. In fact, in the face of such a large amount of information, people do not know how to effectively select the appropriate information, let alone reorganize it into a knowledge system or a framework of curriculum. Worse still, some students are misled by the untruthfulness and even deception of network information due to lack of experience. Therefore, the role of teachers becomes particularly crucial as they can give students correct guidance according to the curriculum system and authoritative teaching materials developed by experts, so that students can make enormous progress in a short time.

To sum up, in spite of the huge amount of information available on the Internet, I am still convinced of the indispensable role of human teachers mainly because of the the emotional exchanges and necessary guidance which are made possible by talking and training face-to-face.

观点类 大学生应该自己支付所有的学习费用

Some people believe that university students should pay all the cost of studies because university education only benefits students themselves not the society as a whole. To what extent do you agree or disagree?

范文:

I would argue in this essay how irrational the claim that university education would be worthless to the entire society but only benefits students themselves is and how ridiculous the logic is made by the topic.

Before scrutinizing whether the benefits are or are not gotten by the society, we must first consider what “benefit” is. There is definitely a universal definition of what “benefit” means, and usually it means the “advantage that may be resulted from an action”, and in that case, the whole society would really benefit from the sending of its students into university. Such positive outcome mainly is reflected in the possible phenomenon, in which the society would largely have talents on specific areas that may mostly contribute to its own paces. This is mainly because once the enrollment of college is implemented, students that are with qualified learning capabilities would be imparted with the majors that are directly linked to the further development of the society in every aspect. That may, superficially, not allow some to see past the immediate return that this action may bring because of a relatively long-period (at least 3 or 4 years) nurture, and rob them of the opportunity to recognize the potential that lies, but one must know that the knowledge given to the education receivers, and the giftedness that is discovered during the process are what lays the foundation of all the reasonings that follows. Certain university students or graduates may not seem like much or certainly may not surmount to anything on its own. However, sets of related talents, experts and professionals in all areas grouped together are what constitutes insights into new discoveries, theories into practices that are close to the life power of a social community, or one day may also the cornerstone of other even more crucial breakthroughs.

The fault premise, then seems directly leading to the unpersuasive property of the belief claiming that students should bear all the costs of the university on their own, but the truth may somehow overstep this recognition. Before establishing a causality, one must first deeply consider whether the reasons are necessarily correlated to their possible outcomes. However, the policy with regard to any public expenses to the per-capita well-being from the authority is not directly related to whether the society as a whole would make profits from this, but to whether the related welfare would be fairly and credibly enjoyed by almost every tax-payer; that means, ergo, any proposal of fiscal giving out would sound reasonable if it is truly necessary in meeting the living requirement of most residents on the basis of ensure the balance of all the financial allocations. It is then clear that the education output concerning university students is really doable, because the high-level education, on the one

hand, is definitely a common, fundamental enjoyment that is endowed to any internal dweller who has the ability to be enrolled after passing the related tests and examinations, and becomes actually difficult to some in terms of the tuitions and other educational expenses on the other. What the governmental act, therefore, should be to break down the barriers for those who have talents but would be precluded from the path to college education because of impoverishment; there is certainly no need for them to pay all the costs of their studies, no matter who would truly benefit from this.

In conclusion, I would very much disagree that the society would be not a beneficiary in the university education, and that students have to pay all the studying expenses is impractical and is out of the correlation to who can actually be advantageous.

观点类 政府应该为所有人支付大学教育费用

Some people believe everyone has the right to get university education; therefore, government should make it free to all people no matter of their financial background. To what extent do you agree?

范文:

Thanks to the continuous evolution of human civilization, the compulsory free primary and secondary education has been a commonplace across the globe. Some assert that the tuition-free policy should be also implemented in the tertiary education. Personally speaking, I doubt the feasibility of such a proposal.

Admittedly, the right to receive higher education should be guaranteed by the government to some extent. It is evident that providing high education to the general public is the responsibility of any government that imposes tax and therefore allocating part of its financial budget into such fundamental social sector is required. Besides, this right should not be deprived of for some economic reasons. If some diligent and gifted youngsters were denied by their desired universities just due to their disadvantageous family background, this inequality would cause their vicious cycle of poverty or crime and even the widened gap between the rich and the poor in the society.

However, entire reliance on the government for university tuition is also not reasonable and students should also shoulder some financial responsibility. To begin with, free university education is more likely to impose considerable financial burden on governments. Even in the economically developed region like Europe, the policy of free tertiary education merely exists in few countries such as Germany and Sweden. In many other countries the more pressing issues like backward medical system and food shortage are still plaguing most of the citizens there and hence, in urgent need of priority given by the authorities from the tight fiscal budget. Furthermore, the graduates from universities not only gain academic knowledge but also access some vocational skills, which will empower them to be independent economically in the future. Accordingly, as the beneficiaries of university education students should also pay for their education.

Taking into account all these factors, we may reach the conclusion that to popularise the idea of free university education is still unrealistic to a majority of nations in the world and students should also be responsible for the cost considering the significant benefits to themselves.

利弊类 政府付一部分或全部的学生的学费

A huge amount of money goes towards children's education. In some countries, the government pays some or all of the costs. Do the advantages outweigh the disadvantages?

范文:

In view of the fact that people who have college qualifications may enjoy prospects of higher earnings, some people, therefore, argue that tuition fees should be paid all by students themselves rather than be partially compensated by the government. Personally, the benefits overshadow the drawbacks.

One of the merits is that paying the full cost means students from underprivileged families may find it possible to afford the tuition fees required by the university. As a result, the drop-out rate among lower-income families might be minimized. Moreover, the gap between the rich and the poor may be narrowed since receiving higher education has always been regarded as a prerequisite of obtaining jobs with higher earnings.

The second advantage of paying the some or full cost is that this would increase the public trust of the government, which plays a very crucial role in solving the current problems. In other words, higher education is for public good, by which I mean ensuring that citizens receive higher education is crucial for social advances, not only for personal development. As a matter of fact, no matter what kinds of occupation people have in the future, they will contribute to the country in our own way, such as being a tax-payer, so it is the responsibility of the state to guarantee citizen's fundamental rights, which will in turn make people contribute to the country better.

Admittedly, if college tuition is all paid by the government rather than students themselves, the burden of the government will obviously be worsened, and the financial resources would have devoted to other civil constructions, such as building subways or medical care, which is also a way of making citizens' lives much easier.

To summarize, I am firmly convinced of that students should not pay the full cost of their college studies mainly because of the possible financial difficulties which will be faced by underpaid families as well as the nature of higher education.

范文 2:

Education doesn't necessarily lead to the vigorous growth of the economy, but somehow it does, and that is one of the reasons why some governments always spend a large amount of money improving the education facilities as well as compensating part (or sometimes, all) of the tuition fees for

students. There are also other reasons: a high literacy rate also underpins a more balanced social development and contributes a lot to the welfare system. However, there are still debates over whether this type of investment is truly worthwhile or provoking more negative consequences.

There are reasons why people hold a negative attitude towards the governmental funding flowing into public education. Since education is a long-term return, no one knows whether this is worthwhile; after all, no one can tell the future. The money squandered in the public education sector would be worth it if the positive outcome is seen by taxpayers. However, this outcome is still in vagueness (at least in a short future), but the government spending is huge and transparent; citizens can easily find out through the national statistics how much money per year is redistributed into public education to cover the expenditures that are supposed to be given out by the individual students and their families, but can never see from the numbers what exactly this investment has brought about—some of the money would probably be, if at all, a waste. Worse yet, there is always something more urgent—disasters, greying population, medical problems, etc.—than education. That means, if the government spent too much investing the education, there would be not enough money used in some more essential sectors or given out when emergencies happen.

The thinking listed above depicts a common scenario in which people concern that the educational investment maybe finally in vain, or may reduce the government's capacity of dealing with other public affairs. However, this is not the case if governments are wise enough to have rational budgets. The money collected in either way (taxation or treasury bonds, for example) is certainly not used freely but redistributed through a well-planned monetary policy based on multiple factors such as the previous experiences, the current problems, or the financial needs for some specific purposes. Education funding is always well-prepared after enough money has already been reserved for some higher priorities. In terms of the usefulness of nationwide education, if we put it a little bit further to say what this type of investment may bring about to the entire country, we may have a different view. The money provided by the government in the shape of a grant can ensure more people get educated, and that is an excellent way to nurture more potential talents who would otherwise suffer illiteracy due to poverty. Those well-educated, skilled talents are what dictate the technological development of society as a whole.

In conclusion, I would believe that the possible drawbacks of governments covering some or all the education costs for their citizens are less likely to be the problem, and the advantages are certainly more overwhelming.

观点类 政府只资助好学生奖学金

Government funding for universities should only be provided as scholarships for the best students. Other funding of universities should come from student fees and private organization. To what extent do you agree or disagree?

范文:

Although most individuals are convinced that only the best students can obtain the scholarship offered by the government, this is actually a popular myth that must be exploded. Personally, I believe that if all the other funding comes from student fees and private organizations, this would bring about enormous drawbacks.

First of all, once all the funding comes from students fees, this would exert financial burden on the lower-income families. With the uneven distribution of education resources, it is really hard for the needy students to promote the grades due to the lack of resources. However, charging these poor students may deprive them of the opportunity of learning and lose the access to refined education in universities, by which I mean that they lose opportunities of changing their life.

Besides, schools may also confront with the financial problem if all funding comes from private organizations as these organizations may refuse to fund universities unless universities can fulfill the requirements they asked. For example, some organizations may regulate that their money can be only used to award students with some traits, such as their nationality or their beliefs, but not their academic performances.

Admittedly, providing scholarship only for the best students can definitely creates motivation among students, especially for those who come from impoverished family and have financial difficulties in affording the tuition fees. However, as the number of those top students are quite limited, once they cannot achieve the expected level, those students would become inferior, which would actually be a demotivated means in the end.

To summarize, despite the motivation this approach may provide, I am firmly convinced of the drawbacks brought by computers mainly because of the potential financial difficulties as well as the limitations set by private organizations.

范文 2:

There is a popular assertion that the government should not cover all the spending of a university; instead, government funding should only be given to the best students as scholarships, and

universities should find other sources of income, such as student fees or private donations, to fund their operations.

Many concerned citizens have subscribed to this view on the basis of arguments such as that the government must set realistic public spending priorities due to a limited budget and that students with a proven academic record in their chosen fields of study are likely to make greater contributions to society. But in my humble opinion, instead of reaching a conclusion based on these arguments alone, we need to take a more holistic approach and take into account a number of other equally important factors.

To begin with, not everyone can be the best, but everyone has their role to play in society and a society cannot achieve its maximum potential with just a handful of very talented people. For instance, a space programme cannot be successful with only a few extremely smart physicists and astronauts; millions of well-educated and capable engineers and workers are also needed to ensure the reliable performance of every single component. In other words, university education benefits not only the brightest; it helps every individual member of a society achieve their full potential, which in turn helps the whole society to prosper.

Furthermore, universities do not just provide academic education but also help students to develop socially and personally. Studies have shown that people with a university degree are not only more productive or successful; they also tend to be more socially responsible and charitable. Because of this, access to higher education should be a basic right of every citizen, and only then can we establish a more cohesive and inclusive society, where no one is afraid of taking responsibility for his or her actions. Free university education for all citizens is already a reality in many countries, such as Finland and Germany, and these countries in general tend to have very low crime rates, as well as significantly less social disorder or conflict.

To conclude, despite the fact that some concerned citizens may hold a different view, I disagree with the notion that government funding should only benefit a selected few. Instead, I believe all citizens should be entitled to free university education funded by the government, and the success stories of countries like Finland and Germany have shown that this will have many long term benefits to both the individuals and the society as a whole.

双边类 哪类学生可以被奖励

Some people think only the students who achieve the best academic results should be rewarded. Others say it is more important to reward students who show the improvement. Discuss both views and give your opinion.

范文:

Giving encouragement is a necessary practice in every education system. While rewarding top students can encourage them to study harder, I believe that the reward system should also focus on those students who make progress.

Some people argue that if teachers can use rewards to recognize the excellence of top students, it can encourage these students to study harder, so they can adapt to a highly competitive world. Students will realize that they cannot receive rewards unless they gain an upper hand over their peers. Scholarships are, for example, among the most common rewards which are given to those high-achieving students to improve their motivation. These well-motivated young people will acquire more knowledge at school and get more opportunities for career advancement in the future.

On the other hand, some teachers may prefer to reward students who have improved their academic performance successfully because they think that these students will have incentives to make faster progress. Even those low-achieving students have a sense of achievement since their effort has been valued. Small gifts such as stationery can be presented to those who have managed to improve higher grades in exams, thereby increasing their confidence. If they do not receive rewards, they will have a negative attitude towards education or even drop out of school.

In my view, students who show improvements deserve rewards, since they will study with enthusiasm and develop their skills and talents in the school system. Even though they fail to perform as well as those straight-A students, they will understand that exam grades are not necessarily the only predictor of their future success. Students who have musical talents may be recognized by their progress in musical performances, while those who work for charitable organisations in spare time receive prizes for their volunteer work. By offering different rewards, schools can encourage children to focus on different subjects and choose a career path which suits their talents and interests.

双边类 多数青年上大学有利吗？

Some people believe that a country benefits greatly with a high percentage of young people going to university, while others argue that it only leads to graduate unemployment. Discuss both views and give your opinion.

范文：

Whether a higher proportion of university graduates is a blessing to a nation has divided the general public – while it is a general belief that a younger generation with degrees is an advantage to the country, there do exist opponents who associate the boom of graduates to nothing but unemployment. However, I have to say neither opinion is justified enough to illustrate the entire picture – it would be imprudent to venerate either view over the other while ignoring all possible contributing factors in complexity of reality.

Before scrutinizing the benefits brought by more people with tertiary education, I tend to question the definition of the term ‘benefit the country’, which does not make sense to me without identifying what aspect of the social life the statement is aimed at. When talking about the overall literacy of the majority of a country, we tend to see a high percentage of graduates as a positive indicator, provided that tertiary education endows learners with more academic knowledge than those haven’t attend universities, whether it be mathematics, computer science or literature. Unfortunately, such a benefit does not translate as easily to some practical areas where empirical knowledge is more emphasized – many new employees after graduation are criticized by employers for their incompetency of addressing problems in real business world.

Similarly, it also appears too simplistic to assume that the spread of college education only exacerbates employment. I grant that some graduates, particularly those studying liberal arts like philosophy or anthropology, may take forever to find a job in relation to their profession in a business world where practical vocational skills as accounting are prioritized. However, that is not the whole story, given that in many other sectors it is imperative for job seekers hold a university degree, one compelling example being doctors and lawyers, both of which require applicants to have graduated from post-secondary institutions.

From what has been discussed above, it looks to me that, whether the spread of higher education is a benefit or waste should be considered in accordance with what aspects of the society we are focusing on.

双边类 教育的目的是对社会有用还是满足自身

Some say the purpose of education is to prepare individuals to be useful to society. Others say the purpose of education is to achieve personal ambitions. Discuss both views and give your opinion.

范文:

For centuries, it has always been difficult to reach a consensus on the question of the extent to which the purpose of education is to develop the individual or to benefit society. Personally, I would take the position that the purpose of education is to enable individuals to reach their full potential as human beings, individually and as members of a society.

It is fairly true for most people, that common equations are usually linked between education and personal achievement, solely based on the assumption that education is linked to being delivered within particular institutes in which specific skills, information and knowledge are available. All of these lead to education being recognized through the academic recognition received from studying subjects taught in these educational institutes which obviously contribute to full experiential growth of the individual to meet immediate needs and desires as well as the development of intellectual powers to realize individual potential.

When we look at the big picture, we see personal ambition not as a neutral island separate from, but as an integral part of society. Historically, the purpose of education has evolved according to the needs of society. Education's primary purpose has ranged from instructing youth in religious doctrine, to preparing them to live in a democracy, to assimilating immigrants into mainstream society, to preparing workers for the industrialization. Society has always remained an essential condition for individual to arise and thrive. In order to give a full play of one's potential, one should constantly adapt oneself to a world that is rapidly changing.

In conclusion, as notions of reciprocity are examined, individual uniqueness balanced with the common good and reproduction of society balanced with developing ambition.

范文 2:

The purpose of education is difficult to define and people from different backgrounds may have varying opinions about this issue. Some people believe that education aims to produce efficient and capable promoters for the social progress, while opponents argue that to achieve personal fulfillment should be its ultimate goal.

On the one hand, it is commonly believed that the goal of education is to cultivate useful members for the society. In many countries, schools are funded or subsidized by the government; therefore, the graduates are to contribute in return to the society. In addition, well-educated people not only have sufficient capacity to earning a living, but also can further help to lead the other people, considering the knowledge and skills that they acquire through good education. This fact makes people believe that the purpose of education is to prepare qualified personnel for the development of the society.

One the other hand, there is no denying that personal desire should be one of the most important target in some reasons. First of all, education needs to satisfy dreams of graduates and allow them to show their potential talents. Moreover, if people bear in mind that they can live a better life in the future by studying hard in school, they are likely to be more motivated in their study. When we consider the fact that people with higher education level usually enjoy better living conditions and higher social status, it seems to be true that the purpose of receiving education is for one's personal welfare and aspirations.

In my opinion, education should serve both purposes: the prosperity of the society and the fulfillment of personal ambitions. If we overemphasize the benefits that education can bring to the society, individuals may lose their motivation in study. On the other hand, it is also wrong for a person to forget the social responsibility that he or she should take. Without devotion and commitment to the well-being of all social members, the products of education would be selfish personnel with qualifications.

公众号：雅思情报圈

观点类 培养团队合作

The best way to teach children to co-operate is through team sports at school. To what extent do you agree or disagree?

范文:

Even if the sense of cooperation could be nurtured well through team sports, it is still way too absolute to consider it as the best way to educate the children this.

Through team sports, children learn how to cooperate with each other to win the game. To outperform in those games, every member considers not about the personal value throughout the entire process, but how to behave to make the whole team work. They then must compromise their own behaviors, sometimes, to the team if this can promote better performance, or they have to communicate with their partners to mutually achieve the goal. Then students would soon figure out that the best football players are not always those with outstanding skills or bodies, but those who know how to systemize their peers and coordinate all others to accomplish the mission. That is what is called “cooperation”, and is certainly gained by doing team sports with others.

However, to credit this way as the best would be too extreme, because we also can figure out other means that are equally effective, or even with more efficient outcomes. Once claimed “best”, the methodology should at least be the “only” way that can fulfill certain requirements that other means cannot achieve. Whereas the truth is, however, what the personalities acquired from the team sports exhibited in the aforementioned paragraph can also be realized in other types of activities: the personal sacrifice for other members that are formed in the games and the interpersonal communication, for example, is also likely to be fostered by other teaming modes like forming a debating team, where members should balance their outputs to make sure the expression coordination and it is certainly necessary for them to discuss with others regarding the strategies or performance. Therefore, it is hard to say that the team sports would definitely dwarf this activity in terms of the nurture of cooperation, or vice versa.

In conclusion, I would somehow agree that to do team sports would be a rational way to build up the team spirit or the sense of cooperation, but it is hard to say that this is the most effective way for achieving this purpose.

范文 2:

Nowadays, children’s participation in sports at school is widely advocated and encouraged, as it is considered the most effective way for children to learn cooperation at an early age. However, I

would argue that the value of sports activity in terms of facilitating cooperation is overestimated and adverse outcome may well appear.

It is recognized that children are naturally inclined to compete and games are usually made to include a competitive factor. Sports, obviously and unfortunately, are competitive by nature: only one win and the rest lose. It adds to children's stress by pressuring them to be outstanding within the team and win over the other side, and undermines the accessibility of cooperative thoughts and behaviors. Especially in current social context the idea of winning has been widely accepted and allowed to become prominent part of mainstream. As is often the case that in sports, parents or coaches or even audience on the sidelines, cannot help shouting to urge children to win and to compete rather than cooperate.

Therefore, simply counting on sports to cultivate the sense of cooperation and collaboration seems to be far from satisfactory. Instead, more attention needs to be drawn to create an environment, which inspire cooperation and make it a joyful experience. Children learn character mainly through imitation. They listen, observe and learn skills by watching words and behaviors of parents, teachers and peers. Family and school projects could be devised to include everyone and make everyone feel needed and parents and teachers could guide the children to recognize that everyone has something valuable to offer in a group, and show appreciation for what they have contributed. By deliberately practicing these skills and recreating such atmosphere, we manage to teach children behaviors that will ultimately benefit themselves.

In conclusion, sports activities can be platform for a negative type of competitiveness and sometimes exacerbates such problem. It is more effective to turn everyday into boundless opportunities to point out the importance of cooperation and fuel children to exercise and practice the art of cooperation.

公众号：雅思情报圈

观点类 团队活动更好

Team activities can teach more important skills for life than those activities which are played alone. To what extent do you agree or disagree?

范文:

Before assessing the problem elicited by the topic, I would first think what is the precise definition of “skills for life”. There are of course skills essential to one’s life that are related to team activities, but to say they are more important than some gained by one doing things alone is a reckless claim.

Many consider teamwork can develop necessary skills that overwhelm those gained from doing jobs alone because they see our human being as the very type of creature that never leaves from social community. To these people, anything that produces personal benefits sources from the surroundings. It’s true that things that are done with companies do help to forge one’s personality to better fit in the social life, or sometimes they are never to be omitted if mortals want to be qualified—one can never avoid the ability of cooperating with others in specific areas, nor does he or she acquire more without knowing how to exchange feelings or resources within a group. Those capabilities, however, would never be nurtured well if personalities are put into isolated circumstances, since the activities that are accomplished alone provides no chance for one to communicate, to outdo or even to encounter other individuals.

Whereas the comparison may sound extremely ridiculous when the myopic thinking exhibited in the paragraph overlooks the importance of skills that are fostered by activities played alone; the diversified skills required for one’s life preclude the from doing so. Even though the aforementioned capabilities proved vital are obtained from teamwork, they can never be justified credibly to dwarf the competences that are only procured from the one-man job. Who is to say that the long-time focuses, the independent thinking for every crux of an entire procedure, or the spontaneous, self-reliant arrangement for a system may deemed not as that important as those related to cooperation or leadership? Simultaneously, the claim made by the topic fails to be persuasive also because of the lack of quantification: it is extremely hard to find out the precise outcome, effect or any statistics to measure whether skills taught by team activities are more important than those derived from jobs done by only one person.

In conclusion, it is the unreasonable comparison between the two types of skills in terms of the importance that compels me to question the rationality of the prompt; for any appraisals, they work only when there is methodology to make differentiation.

双边类 独自学习和一起学习哪个更好

Some people think it is effective for students to study in groups in school, while others think it is better to study alone. Discuss both sides and give your own opinion.

范文：

It has long been a heated topic how student should study. While some claim that group work is more effective, other stick to the opinion that students should study independently. To me, considering the potential benefits for their future career, I would venerate collective learning as a more effective mode.

Indeed, it is not difficult to understand why autonomous study is prioritized by some people. For those who think in this way, they may assume that the key quality for students is the independent problem-solving ability, which is considered imperative for youngsters to deal with challenges or tricky conditions in their study. Based on this presupposition, they jump to the conclusion that only by studying in seclusion can students acquire this skill, given the fact that independent learners are more likely to search for answers by themselves, whereas those who study in a group are prone to rely on others for solutions.

However, the above statement is not justified enough to represent the entire picture, I would agree that collective learning is more effective model. Those championing seclusive learning are oblivious to the fact that being an independent problem solver doesn't necessarily lead to a successful student career; by contrast, I would attribute the efficacy of study to other determining factors. Of particular importance is filling in individuals' knowledge gaps. By listening and sharing information with each other, team learners have a greater understanding of the what have been discussed. Another key factor for effective study is to eliminate procrastination – it is also where group study has a role to play: when put in a team, all members have a set time for studying and are accountable to other group members, thus making them less likely to procrastinate about assigned tasks.

To sum up, though autonomous study has certain effects in some cases, it is collaborative learning that wins me over.

科技类

观点类 手机和电脑使人们失去面对面交流的能力

More people are using mobile phones and computers to communicate. Therefore people are losing the ability to communicate with each other face to face. To what extent do you agree or disagree?

范文:

Nowadays, we live in a world teeming with various communication technologies, smart phones, internet, etc. which impart numerous information to everyone whose face glued to their phone. So, there is a natural comfort in connecting behind phone screens than face-to-face communication, which in turn negatively affect this communication ability among young generation who are developing such ability but for adults, the influence seems to be limited.

With the advent of high technology, especially the innovation of communication tools, people can communicate with others more conveniently and swiftly. Thus, when people rely on mobile phones to chat in daily life; at the mean time, this will make it possible to reduce the probability of face-to-face communication to some degree. Therefore, this affects the ways to communicating and people's socializing styles. Besides, teenagers are always obsessed with phone games, which will hamper their communication and makes them socially awkward. Therefore, they should be limited using phones in certain period.

Reliance on mobile phones reduces the desire for face-to-face communication. Some simple communication and conversation will be replaced by chatting with phones. However, this can not manifest that some deep argument and discussion can be substituted by phones. These arguments not only can show the charm of language, but also need body language and some non-verbal communication, while this information can influence others in face-to-face communication.

In addition, thanks to the development of technology, particularly the breakthrough of communication technique, some apps in phones and computers have already mimicked face-to-face communication. Thus, during the process of communication on the Internet, this reflects people's ability of language and talking skills. Meanwhile, this will also enhance the capability of face-to-face communication rather than losing the ability. In particular, in terms of adults, communicating on the Internet will enrich their ways to chatting. Regardless of online or offline, this can also increase their opportunities to communicate. Then, this can expand their socializing circle.

In summary, though I believe that phones and computers are very useful in speeding up communication with others, they may prevent us from finding enough time to communicate with real people in person. Of course, we should reduce the frequency of children using mobile phones to communicate.

观点类 现代通讯对社会关系造成负面影响

Many people think modern communication technology is having some negative effects on social relationships. To what extent do you agree or disagree?

范文:

Technology has revolutionized the way people communicate in both personal and professional lives, linking humans in a real-time network across the globe. However, some worries that technology has also changed communication in many ways, and some of them are not for the better. From an objective perspective, I believe the truth is to be found somewhere in-between.

Technology is an easy target to be blamed for having undermined people's social abilities. As people increasingly rely on typed words and stickers, their emotional sensitivity is decreasing. Non-verbal expression of feelings cannot be learned behind the screen in the way from face-to-face communication. However, for people who already suffer from social anxiety, the Internet is a safe barrier for them to function normally. Behind that barrier, they are inclined to feel more comfortable saying what they want without the risk of embarrassment. For them, it makes it easier to look at the screen than to look at someone in the eye.

Another point in dispute is that technology has affected the quality of communication with both positive and negative outcomes. It is also true that while technology is creating elaborate social networks online, it still unexpectedly is causing social isolation. In some cases, in-person contact is being replaced by on-line communication, which means strong social connections will be inevitably replaced with a larger number of much shallower connections, leading to situations where people may have large numbers of friends but few actual real-world companions. This can lead to depression and feelings of loneliness.

In conclusion, technology is neither good nor bad. It depends on how we use it. The problem is certainly not technology but the direction we have finally given to it. I strongly believe that it is time for us to understand that the responsibility belongs exclusively to humans who have to acquire a social conscience, to keep the balance.

观点类 现代沟通科技优缺点

Some groups of people have benefited from modern communication technology. However, some think they do not have any benefit from this. To what extent do you agree or disagree?

范文:

A growing number of people are becoming aware of the conveniences brought about by technological advances especially the birth of modern communication technology. However, despite all the benefits that communication tools have brought, many people contend that computers adversely affect the communication among people. Personally, I believe that communication has become much easier than ever before.

First of all, some advanced means of communications have considerably facilitated the exchanges of ideas and information among people. For example, people in the past used to write letters which usually took several months to arrive at some distant destinations, but now we can talk to our friends instantly by video-chatting or social networking websites, which is obviously much more convenient than ever before. As a consequence, considering computers as an obstacle is absurd.

Besides, this new technology also brings people closer with strong and lifelong relationship in their life despite the separation of people due to the pursuit of career advancement, education attainment and other personal ambitions. The prosperity of social networking websites, blogging and discussion forums has witnessed the boom of interaction among friends, relatives and strangers, by which I mean through the comments and dialogues following the pictures and videos provided on these platforms, people are never alienated from their beloved ones despite the geographical barriers.

Admittedly, modern communication tools might also contribute to the communicative disorders in some cases if people indulge themselves in the virtual world. As was revealed from a recent report, about 60% college students in China spend 5 hours or utilizing mobile phones, which substantially impedes the communication among friends as well as family members.

To summarize, although addiction to communication tools may lead to disorders, I am firmly convinced of the benefits brought by them mainly because of the diversified types of communication tools that are available online as well as.

范文 2:

Modern communication technology has developed beyond imagination. The advantages of convenience and high efficiency brought by digital communication are obvious, but I do not think that everyone has access to these benefits.

On the one hand, the electrical devices and telecommunications have become increased, which help us collect new information better, become more well-informed and connect us with each other wherever we are. Because of these technologies, learning can be incredibly efficient and effective, as students having the internet connection can virtually solve all their puzzles by browsing teaching websites or asking for help from teachers simultaneously. Also, Internet-based communication contributes positively to strengthening family relationships and increasing closeness between family members. For example, students who attend boarding schools or study abroad are able to keep in daily contact easily with parents by sending greeting messages or camera chatting. What's more, companies can be run at a much lower cost because the internet and computers help to expand business cheaply and because information technology allows employees to work at home, which saves most of the rents for office space.

However, I would argue that the benefits of information and communication technology are restricted to certain groups of users. In other words, some people, particularly the old and the poor, are not beneficiaries of modern ways of communication. With regard to the former, a large percentage of elderly people are unable and reluctant to adapt to new technology, which means that they barely enjoy the convenience and fun brought by the devices. As for people living in extreme poverty, mobile phones, computers and any other electronic devices are luxuries. Also, some elder people are not willing to use electrical devices as it is much harder for them to learn how to use it compared to young generations.

In conclusion, presence of telecommunication has brought a significant advantage to most people, however, there are a certain of groups who don't benefit from it.

利弊类 通过网络减少面对面沟通

People today can shop, work and communicate with others via the Internet. They don't need to do these face to face. Is it a positive or negative development ?

范文:

The Internet technology has allowed people to carry out numerous tasks, including shopping, without meeting others face to face. It is by and large a positive development, despite the potential impact on social connections.

The use of the Internet for daily communication can enhance productivity and yield economic benefits for individuals and companies alike. In this competitive world, efficiency is a lifeline for people and companies, as the faster they complete work, the bigger market they can secure. If they talk to clients and suppliers online, they can exchange messages easily, confirm details of an order and conduct business efficiently without traveling a long distance to meet each other. Similarly, by placing an order on e-commerce websites and having products delivered to homes, working people can cut the time for shopping and stay in the office if necessary to finish a project before the deadline. High levels of productivity can put them ahead of competitors and satisfy the needs of customers promptly, thereby winning more contracts and earning more money.

Another benefit is that Internet-enabled communication can reduce the need for transport and avoid pollution. The development of online communication tools, such as video chatting, have empowered people to talk to each other in real time without experiencing any delay. They do not need to visit clients personally or shop in a bricks-and-mortar store to buy what they want. This means that a growing number of people can work remotely or shop in the comfort of their homes, rather than driving or using public transportation to offices or high streets. Emissions from vehicles decline and the environmental problems arising from exhaust fumes can be mitigated or prevented.

On the other hand, if Internet-based communication substitutes for face-to-face meetings, community activities, family life and interpersonal relationships can be under threat. There are some heavy users of telecommunication technology who become increasingly unsociable, as everything can be virtually carried out online, ranging from discussions of work-related matters to grocery shopping. They may not feel the need to socialise with colleagues or business partners, or to communicate with shop attendants of convenience stores around the corner about the latest news of the neighbourhood. They even miss out the opportunity to enjoy a shopping trip with family, talking about what to buy and choosing gifts for special occasions. Technology may keep some people apart and foster a sense of isolation among them.

In conclusion, I would perceive a drop in face-to-face communication as a positive trend given the economic and environmental benefits, although for some people, they may feel disconnected from other members of community.

范文 2:

Thanks to the development of communication technology, nowadays we can accomplish many of our everyday tasks without meeting each other in person. In my point of view, the benefits of this outweigh the drawbacks.

It is clear that fulfilling some tasks without seeing people face to face is highly efficient. In the past, if we needed to buy something, we had to go to the shopping mall; but nowadays all can be done just with the click of a mouse and the goods will be delivered home, even at a lower price. And if we want to make a transaction from one bank account to another, we do not have to go directly to a bank or wait for a desperately long queue; instead we may comfortably make use of the self-banking service at home with access to the Internet. Thus, efficiency of work and life has been both highly improved owing to the technological advances.

On the other hand, lack of face-to-face communication also brings some problems. One of the biggest concerns is the safety. With increasing virus threats and well-trained hackers, online deals such as bank transactions are well exposed to heavy loss as well as to great convenience. Identity theft and other problems should be well noted by either individuals or various organizations, too. Another problem may lie in the fact that people might become somewhat indifferent and feel isolated in the long run, without meeting others face-to-face, since they are emotional creatures. However, these problems can be addressed with the efforts from government. When the authorities enforce stricter laws to deter the potential cyber criminals, there will be less risk on the Internet. With the concern to the interpersonal relations, people can still organize other forms of off-line activities, such as parties, to promote their multilateral relations.

Overall, there are both favorable and unfavorable effects on individuals and society if everyday tasks are performed without people meeting each other. Personally, I am fairly optimistic about its future and I also fully understand the necessity for both individuals and government to pay adequate attention to the safety of such dealings.

观点类 科技让我们的生活复杂还是简单

Some people argue that the development of technology makes our life complex, so we should make our life simpler without using the technology. To what extent do you agree or disagree?

范文:

I would argue in this essay how the claim has misguided the true reason that leads to the complexity of life, and how absurd the thinking seems towards the development of human civilization.

Technology certainly is not the true reason leading to the complexity of human life, but the most effective means making it less complex than it should be. For those myopically treating technological improvement in a misunderstanding way, the booming of the daily changing paths, the prosperity of the cutting-edge tools and the emergence of those brand new scientific discoveries have made our life unnecessarily complicated: we have to spend our time and energy learning new technologies, most of which become outdated even before we start to handle them; we are flooded with an abundance of information brought by the stream media that is distracting us from doing jobs easily. But they have been confused in the superficial phenomenon, and are puerilely blaming all these on the development of technology. The civilization of human compels us to complicate our life, no matter how technology is developing, in which we are forced to further our paces to the other parts of the world to deal with the over-population, or we have to get access to methods to release the resource shortage or environmental pressures, or sometimes we need information to know what is going next to our surrounding. Therefore, technologies, or should I say the new way mankind has established to better our living when we need more than what nature can confer, is allowed to reduce the complexity so that we can maintain our living path without so many barriers—to travel faster and further with automobiles, to communicate more swiftly with network, or to learn more easily via multiple-media.

To make technology isolated from human life, therefore, sounds extremely ridiculous after we have realized the truth that technology is not doable. Before scrutinizing the topic, the problem should be first clarified: for human being, is the recurrence of the previous, simpler life necessary? Social advance, or should I say, the improvement of any species is a gradual, spiral up way leading to a state of complicity that has the capacity to face the fierce surrounding and hardships that may come along. To live in a simple life, ergo, though imaginable, is never realistic when human world is developed as its own pace. Simultaneously, avoiding technology use is just the ideology provoking the human life into a more painful and complicated situation. We now cannot imagine how ourselves, and our descendants would be struggling with their lives in a world without modern transport, high-rise buildings, or communicating applications, since they are, despite flaws, the most proper solutions we have ever figured out to address all the current issues faced by men when experiencing the increasingly populous society, the surging urge for landing and energy resource, the escalating

demands for communication and unity, or even the macro perspective for searching another living place over the space for the long-lasting species continuation.

In conclusion, it is the human nature and the global development that compels us to live more complicated, and technology is endured with the fate of simplify them. Thus it is irrational to reduce our technological dependency for the realization of the impractical simple life.

公众号：雅思情报圈

利弊类 新科技改变孩子娱乐方式的利弊

New technologies have changed the way for children to spend their free time. Do the advantages outweigh the disadvantages?

范文:

A growing number of people are becoming aware of the transformations brought about by technological advances especially the birth of computers, mobiles phones and Internet. However, despite all the benefits that electronic devices have brought, many people contend that there are more drawbacks after changing the way of spending leisure time. Personally, I believe that children have obtained more benefits after the alternation.

First of all, with the advent of computers, free access to various kinds of information has been realized online. Since the source of online information is abundant, under the guidance and supervision of parents young people might benefit from early exposure to the Internet. If people are able to browse the Internet at a young age, they can start their learning process earlier and as a result can advance their knowledge as they grow up.

Besides, the cognitive development of children can be substantially enhanced by enjoying playing computer games. For example, strategic games such as Might& Magic Heroes can cultivate children's sense of crisis-solving as players have to deal with unexpected situations, and this kind of situation in the virtual reality cannot be easily accessed in the real world.

Admittedly, computers might also contribute to the communicative disorders in some cases if people indulge themselves in the virtual world. A case in point is that numerous college students in China spend a large amount of time online and do not have sufficient time to communicate with others, which may give rise to the alienation among them.

To summarize, although addiction to computers may lead to disorders, I am firmly convinced of the benefits brought by computers mainly because of the enormous amount of information as well as the diversified types of communication tools that are available online.

范文 2:

While advanced technology is revolutionizing the leisure life of younger generation, I tend to say that we should pay more attention to the dark side of the phenomenon in terms of its detrimental effects on children's personality development and behavior.

Superficially, it cannot be denied that the entertainment and social life of the younger generation have been more diversified thanks to the emerge of new technology as computers and the Internet.

For example, living in a world connected by the ubiquitous Internet, today's children are able to make new friends with peers at any corner of the globe, which is inconceivable to their predecessors who lived in the world without online social media as Facebook or Twitter. Also, another benefit we should not forget is the computer skills children acquainted from playing video games, which has become an indispensable qualification in study and future careers.

Beyond these seemingly benefits, is my apprehension about the potential risks of this technical trend. The first problem is that it would isolate young people from the real world. When disappearing down in the rabbit hole behind screens, youngsters are alienated from friends or family members in real life, which might lead to the psychological problems, such as self-centeredness, indifference and inconsideration.

Apart from that, another risk we cannot afford to ignore is the obscene content on the Internet, say, violence, erotic pictures and videos, and other disgusting information. Being exposed to these materials, naïve young minds are more likely to be eroded and, more seriously, they are prone to imitate these misbehaviors which may lead to unforeseeable ramifications.

Given this, I have to argue that more attention needs to be paid on the negative influence on the next generation inflicted by new technology.

观点类 核能是不是最好的能源？

Nuclear energy is a better energy source for countries to meet the ever-increasing energy demand. To what extent do you agree or disagree?

范文：

Rapid growth in demand has given rise to power shortages, and the reliance on fossil fuels has led to much air pollution, by which I mean the impetus for nuclear power in some countries such as China, Russia and France is increasingly due to air pollution from coal-fired plants. However, the merits and demerits of nuclear energy have made this alternative energy source one of the most controversial on the market today. Personally, I believe nuclear power is a crucial energy resource to meet the future demand.

First of all, nuclear power can be considered as an ideal choice to replace thermal power in terms of the raw materials. On the one hand, despite the high investment of constructing nuclear plants, the average life span of nuclear power is approximately 20 years longer than the general thermal power station, and meanwhile the efficiency of generating electricity is also much higher, that is to say, the feedback after completing the nuclear station is impressive. On the other hand, compared with other alternative power such as hydro power, wind power and solar power, there is no intermittent and less constrained conditions, by which I mean the utilization of nuclear can guarantee the sustainable and stable supply of energy regardless of the weather or geographical situations.

Besides, nuclear power can be regarded as an environmentally friendly energy source. In other words, during the procedure of generating the electricity, the carbon emissions will not be emitted, which would have otherwise been enormous resulted from the burning of fossil fuels in thermal power stations. This would give rise to alleviation of the global warming as well as the contamination of atmosphere.

There are, however, some obvious disadvantages of nuclear power. Despite the high level of sophistication of the safety systems of nuclear power plants, the human aspect has always an impact. Facing an unexpected event or managing a nuclear accident, a disastrous failure might happen somewhere. However, with the technological advances, all these shortages can be strategically addressed in the future.

In conclusion, in spite of the drawback caused by the current technology, it seems to me that the nuclear power can be an irreplaceable option to satisfy the future power demand mainly because of its high efficiency and environmentally-friendly characters.

双边类 科技对食物种类和质量的影响

It is known to all that the technological and scientific advances have made greater changes to the range and quality of our food. Some people regard it as an improvement while others believe that the change is harmful. Discuss both views and give your own opinion.

范文:

Scientific advances have an impact on many aspects of our lives, including food. I believe that the increase in food varieties can be beneficial to mankind, although there are some problems.

The development of food technology can be beneficial to the health of many people. This is because they are provided with a wider range of high-quality choices to adopt a balanced diet. For example, some perishables such as fruit and vegetables can be preserved and made available for people in cold climates. Some diet supplements have also been developed to improve the nutrition of our diet and promote our well-being.

On the other hand, some people argue that the application of advanced food technology can pose health risks, although it can give us more options in our diet. Genetic engineering, for instance, modifies the genetic characteristics of natural crops, but the health consequence of eating these crops is yet to be known. In addition, some chemicals have been used to increase the shelf life of some foodstuffs, despite the fact that these chemicals can harm our health.

In my view, the agricultural industry is able to feed a growing population because of technological advances. The main reason for this development is that technology makes a variety of crops resistant to pests and diseases and also enables these crops to grow faster. This can boost food production. These emerging technologies are especially important for developing countries or heavily populated countries, where many people suffer from malnutrition.

观点类 科学实验浪费时间和金钱？

Some people think a lot of scientific research done today is a waste of time and money. To what extent do you agree or disagree ?

范文：

Recent decades have witnessed enormous transformations brought about by technological advances, despite the fact the investment required for scientific experiments is indeed enormous. Therefore, there are some people who criticize that the investment in many experiments is a waste of time and money, which I absolutely disagree with.

First of all, the title of the script itself is rather subjective and cannot be quantified, as we cannot give accurate quantitative standards to the term "a lot". The reason why people have such a view is probably that they exaggerate the existence of this phenomenon after seeing several reports of the failures of scientific experiments. Second, these people misunderstand the essence of scientific experiments, even science itself, by which I mean scientific theories are falsifiable, namely, theories can be falsified and replaced by new theories after trying hundreds or thousands of times through diverse categories of researches solely depending on the hypothesis or the previous experience proposed for problems. Therefore, "failure" is allowed and it is normal to see that the relevant investment and even sacrifice for the previous theory is not understood by later generations, but these initial investments actually provide the basis for the subsequent innovation.

Admittedly, due to the limitation of current technology or funding, some short-term scientific researches may seem to have no clear objectives and people cannot receive the direct rewards, which may be regarded as some kinds of "waste" by those critics, but stopping such experiments would have worse consequences. For example, in this year, coronavirus is spreading all over the world, and enormous labor and material resources have been invested to related vaccine researches to cure the virus. Unfortunately, up to now, all countries have yet succeeded, but this does not mean that the initial investment is wasted, and once the relevant scientific research work stops, not only would people lose confidence in defeating the virus, human beings also would be exposed to unprecedented disasters.

In conclusion, it seems to me that there do exist uncountable failed researches in the modern world, but the failure in experiments may be the beginning of discovery, which should never be considered as "waste".

双边类 科学家的作用

Some people say politicians promote the development of society. However others believe that it is scientists who have more influence on the world. Discuss both views and give your opinion.

范文：

There is an opinion that political leaders act as the catalyst of world progress, while others argue that scientists play a more important role. From my perspective, neither of the two views is justified enough to represent the entire picture; both parties make their claims based on stereotyping their ideas.

On the one hand, it is generalized to venerate politicians over others with reference to their relevance to social development. In retrospect, while there do exist some political figures who have made contributions to boost the progress of human civilization, it is illogical to assume the whole political community processes the same quality of its individual member; the appropriateness of using this idea should be determined on case-by-case basis. One convincing example can be seen in Adolf Hitler, the leader of Nazi who put the whole world in jeopardy by starting the second world war.

By the same token, it is also an erroneous belief when some people assume scientists superior to others in terms of their contributions to the world progress – those overestimating the role scientists are oblivious to the fact that the influence of any professional groups is domain specific and context dependent. Based on this, the discussion can then move on to handle questions as to which social impacts are more desirable in the local context and what local stakeholders value more. Indeed, in countries where technology breakthroughs are prioritized, it is scientists who deserve more admiration; however, in countries whose primary affliction are sociopolitical conundrums such as ethnic conflicts, I don't believe science will have much of a role to play.

From what has been discussed above, it is my conclusion therefore, both statements in the topic are generalized if not contextualized.

利弊类 许多工作依赖机器完成

Nowadays more and more jobs and tasks are done by machines which involve hard physical work. Do the positive effects of this trend outweigh the negative effects?

范文:

A quick reflection on a typical day reveals how technology has revolutionized the world. During the workday, most jobs that are used to be done by manual labor would now be undertaken by machines. People in the past can never imagine that they may no longer suffer from hard physical work and a somewhat extreme working environment but only manipulate computers that process information on silicon bridges. However, the occasion also raises the issue that practitioners from a wide range of professions may worry about them being unemployed because of this.

There are pessimists out there attempting to bridge the dramatic changes to some side effects. The assumption is that the increased reliance on machines to do physical work that is supposed to be done by manual workers may directly lead to a large quantity of unemployment. It is outstandingly obvious that which side would do a much better job if there were a competition between iron-based structures and protein-based life forms in things like, say, lifting a hull from underwater or assembling parts of an engineering facility. Those machines also prove that the growth of the related productivity would be exponential: compared with hundreds of physical laborers in the old days, they only need a limited number of operators and never need a rest, nor do they require a paid holiday off. Besides, the decreasing initial investment in purchasing machinery and maintenance due to their increasing industrialization also leaves no place for manual workers. Each of these occasions would finally lead to millions of people, ranging from porters to woodcutters, getting fired from their jobs. The worst-case scenario may be akin to that numerous families lose their living support, out of incomes for months and suffering from long-term poverty.

Such a state of mind is based on the premise that most individuals depend on heavy work to sustain their living and that they would never look for a change in their career path. There is, however, an alternative possibility that most of those manual workers deeply know that they cannot live like this forever because their physical conditions may get worse with aging. In that case, the prevailing mechanization appears to be a perfect chance for them to opt-out of their established, physical labor-oriented profession immediately and to adapt themselves to the rational process of social development. The popularity of machinery implies that it can become the substitute of most dangerous jobs like mining underground or search for lives from ruins; without this to go by, potential disasters to happen on humans who otherwise have to do those jobs may be too easy. The scenario also provides new employments, attracting employers to recruit a large number of program developers, operators, and logistics. While this type of transformation may still take a while to fit with the general needs of the society, it is worth it to wait for the ambitious plan to realize.

Technological improvement always marks the human experiences, and every time the revolution comes, there will be no limit to the number of problems, both new and old, for us to tackle. There is no need to retreat to a Luddite attitude to new things, but rather hopefully see the possibilities the technology brings to us.

范文 2:

The advanced technologies are massively used in many aspects nowadays, and they can complete many things that used to be done by human labour. From my perspective, though it has some potential shortcomings, this development can be regarded as positive.

On the one hand, the benefits of robots are undeniable. Firstly, robots can perform some risky task for human beings such as mining and exploration in extreme conditions. In this way, people's security can be greatly enhanced if these perilous tasks are undertaken by them. Secondly, robots can work more efficiently and accurately than their human counterparts. The workload which could take days to finish by manual work could be done by robot faultlessly within several minutes. For example, when assembling the micro electronic devices, robots undoubtedly accomplish this task much better than human. Since being substituted, human beings have more time and energy to fulfill other tasks or enjoy longer leisure time.

On the other hand, the downsides of too much reliance on robots cannot be ignored. The most obvious one is the decline of employment rate. Since the incomparable efficiency robots possess, different industries are gradually replacing human labour. Because of the adoption of robots, thousands of works are dismissed from their work and they have to seek other occupations. In addition, if people are overly dependent on these machines, our society will fall into the chaos once robots cannot function normally, not only for the industrial production but also people's daily lives.

To sum up, although robots may bring the problems like reducing job opportunities and over reliance on them, they do make the production more efficient and free people from heavy work.

利弊类 机械化的好坏处

In today's society, more and more work is done by machines. Do you think the positive effects of the development outweigh the negative effects on individuals and society?

范文:

It is true that the modern world is moving in a direction where more routines are doing by machines. While this trend is applauded by many people, I would say that we should not be too optimistic when considering its detrimental effects on individuals and society.

Superficially, the trend of automation does seem to benefit the world in various aspects. At an individual level, the trend liberates many people from mundane tasks, allowing them to do something more meaningful: farmers can spend more time and effort to focus on market price and the sales when mechanized farming releases them from the routine tasks like sowing and turning up soil. Also, In the eyes of entrepreneurs, what concerns them most is the increased productivity and efficiency thanks to the wide application of machines.

However, in my opinion, these benefits mentioned above should be considered from an opposite angle. Firstly, rather than liberating people from mundane work, the era of mechanization has also witnessed the extinction of many handicrafts and traditional skills. Taking this problem one step further, with hand-made artefacts being ousted by the faceless uniformed products from assembly lines, what frustrates us more is the lack of national identity and diversity and richness in cultures worldwide, given the fact that a nation's cultures, customs and ethos are inextricably bound up with its traditional artefacts. Another problem we cannot afford to ignore is the unemployment problem ensued: while manufacturing sectors enjoy the dividend using robots replacing human labors, what will ensue is the unemployment of millions of workers, a problem that is hard to swallow for any governments.

In conclusion, I would say that the industrialization should not be at the sacrifice of the traditional skills and unemployment.

双边类 电脑愈加智能对人类是好是坏？

Some scientists believe computers will become more intelligent than human beings. Some people think the development has a positive impact, while others think it is negative. Discuss both views and give your own opinion.

范文：

For decades, technological developments compound upon themselves and the more advanced technology we create, the easier it gets to create even more advanced technology. As a result, there are fascinating controversies regarding to whether it would be benevolence or malevolence that we are going to create artificial intelligence that rivals or even surpasses our own. Personally, I would argue that both sides contain some truth.

In the near future, it can be inferred from past experience that we are better off than we were just a few short years ago largely due to technology becoming better, cheaper and more widely accessible, that when the problem-solving capabilities of computers outstrip ours, life will become unimaginably but definitely pleasant and problem-free. All diseases will be cured as future technology like nanobots will repair our cells and reverse aging process or remove excess fat and sugar so that we will no longer have to keep to a strict diet. And just in case our physical bodies fail to live forever, it is proposed that we are investigating the possibility of the ability to upload our brains into the cloud and live in a virtual world long after our physical bodies vanish.

However, if this trend continues, fears of potential risks arising from computers outsmart humans seem to hold some ground. As those smarter computers will likely be able to design and improve upon technology and create new ones that we may not even begin to fathom, it also means that we are ceding intellectual authority and expertise to machine. Intelligence enables control: humans stand at the top of food chain not because we are stronger, but because we are smarter than the rest. Thus, if we cede our position as smartest on our planet, it is possible that we might also cede control. Although most researchers agree that even a superintelligent computer is unlikely to exhibit human emotions like love or hate, and there is no reason to expect artificial intelligence to become intentionally malevolent, still we lack solid basis because we have never experienced anything that has the ability to wittingly or unwittingly, outsmart us.

In conclusion, amplifying our human intelligence with artificial intelligence has the potential of helping human civilization flourish like never before, as long as we manage to remain in control. On the other, once computers successfully surpass our own especially in many domains previously thought to be uniquely human, there are some practical dangers we had better be aware of.

利弊类 线上购物取代实体店

Online shopping is now replacing shopping in store. Do you think it is a positive or negative development?

范文:

Shopping online has revolutionised the way people purchase commodity, and many physical stores are gradually being replaced by online ones. From my perspective, despite the potential drawbacks of online shopping, it makes our lives much easier and more convenient than ever before.

Online shopping has its incomparable advantages. To start with, it enables customers to have more choices by browsing the numerous goods on the shopping websites. Compared with the traditional physical store, online stores provide commodities from all parts of the world for consumers to choose. More favourably, customers have more controls over the online purchasing process since there will not have any pressure from sales assistants. Hence, they can take their time considering whether to buy or not without any outside concern. In addition, products will be delivered within several days to your doorway, which saves much efforts of carrying the stuff around, especially those heavy ones.

On the other hand, there are still some potential drawbacks regarding online shopping. First of all, since the product cannot be seen with their own eyes, customer may be misled by the false information provided by the sellers. To make it worse, the refunding and returning process is often very complicated and time-consuming, which wastes the time saved from shopping online. Besides, Information leakage may also come along with this way of making purchase sine we are required to provide our personal information. If the information fall into the wrong hands, our security will be threatened.

To sum up, although internet provides us with convenient ways of shopping, it also has some potential disadvantages, and it cannot fully replace the traditional stores in a short term.

公众号：雅思情报圈

范文 2:

It is increasingly common for people to go online to buy what they need rather than going to a shop. Although there are some dangers and disadvantages to internet shopping, I believe that it is a positive thing.

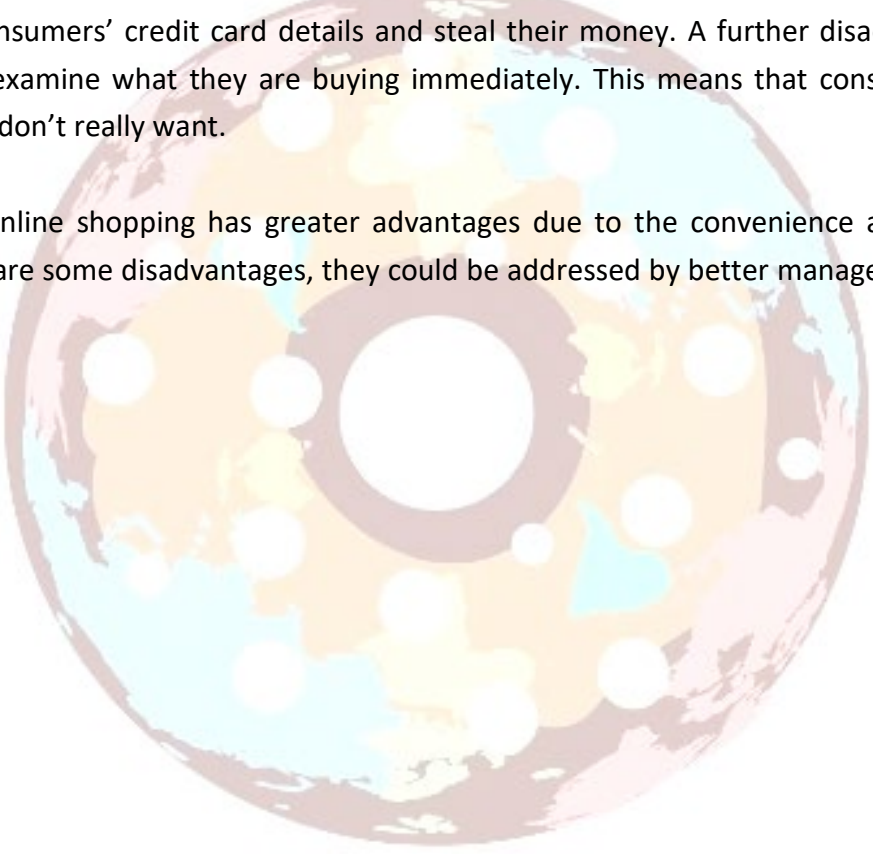

First of all, the main advantage is the convenience. People don't have to go to shopping malls, instead, they can buy whatever they need just with a click of the mouse. Also, they can make their purchase

at any time of day or night. This type of shopping is very beneficial for those with hectic lifestyles since it provides a good opportunity to save time and also avoid crowds.

In addition, online purchase tend to help people save money. The first reason is that internet companies don't need a physical shop, the products which they sell are often cheaper. Another reason is because customers can easily browse through dozens of different websites to find the best price. Of course, they can do the same at a mall, but it would take about an hour or longer.

However, there are two main problems. One is the Internet fraud. In other words, hackers may be able to copy consumers' credit card details and steal their money. A further disadvantage is that people cannot examine what they are buying immediately. This means that consumers may buy something they don't really want.

In conclusion, online shopping has greater advantages due to the convenience and lower price. Although there are some disadvantages, they could be addressed by better management and after-sales service.

公众号：雅思情报圈

观点类 政府的太空开发投资是否合理

Some people believe that spending money on developing technology for space exploration is unjustifiable, there are more beneficial ways to spend money. To what extent do you agree or disagree?

范文:

Over the last few decades, with Armstrong's successful landing on the moon, people have never stopped exploring this mysterious field, pouring millions or even billions into outer space. Some people doubt the justifiability of this issue, but I hold the opinion that this effort makes sense.

Undoubtedly, government's budget is limited and ordinary people are more interested in public facilities such as water supply system and education, which have a direct impact on their living standards. For instance, good sanitation and clean water can improve people's physical health and reduce diseases, while schools offer an appropriate atmosphere to popularize knowledge and improve youngsters' job prospects. These improvements seem to be more essential for most city dwellers.

However, skeptics of space research take it for granted that other areas including public facilities deserve more public money, ignoring the human endeavor made in space exploration and its substantial benefits, some of which are likely to be invisible in a short term. The fact is that several technological advances have been applied widely in people's daily life and exert an indispensable influence owing to the development of space exploration. People are accustomed to viewing weather forecast before going out and using the navigation systems on the cell phone to find the best way to unfamiliar destinations. What's more, the problem of population explosion has become increasingly severe; therefore, it is understandable to look for other suitable alternatives with larger space to hold more people via investing in the space research.

In conclusion, although some other fields affect citizens' lives more directly, it is justified for governments to allocate certain amount of money to explore the space especially if their budget is not tight.

双边类 联系外星人的好坏处

Some scientists believe there are other intellectual life forms and people should send messages to them. Others believe it could bring about dangerous consequences. Discuss both views and give your own opinion.

范文:

Scientific exploration towards the outer space is no longer impossible thanks to the advances of the technology. People hold conflicting views about whether to seek other intellectual creatures. Some believe that it is necessary to contact with them while others argue that it may bring us to a catastrophe. Personally, I prefer the former.

People who are against connecting other intelligent lives may believe that it may cause unpredictable lethal outcomes. It is true that we know little about the extraterrestrial intelligences' intentions and capabilities, and it is almost impossible to predict whether they will be benign or hostile. Searching for planets that might have life like staring into a great abyss since we have no clear knowledge of the first form of life we discover. They might be greedy, exploitative and violent while searching somewhere to harvest for water, minerals and fuel.

However, getting in touch with the extraterrestrial lives also have potential benefits. Firstly, the frontier technological and scientific advances in space programs could be utilised in our daily lives. For instance, we are largely relying on the use of satellites to locate or provide us guidance. Secondly, if we can communicate with other life forms someday, we may have the chance to exchange ideas with them, and there is a great opportunity to make immense progress in modern technology by their inspiration. Therefore, many problems we are facing could be solved.

From a personally perspective, humans should not stop exploring the extraterrestrial lives regardless of the potential threats mainly because human beings are born curious about the world and universe, pursuing that curiosity is one of the reasons why mankind made such great achievements.

双边类 科技对贫富差距的影响

Some people believe that the range of technology available to individuals is increasing the gap between the rich people and the poor people. Others think this has an opposite effect. Discuss both view and give your own opinion.

范文:

I would discuss in this essay why there is increasing divergence of attitudes towards widening the range of new technology available to individuals and find out a way to balance the two polarized opinions that are either too skeptical or too optimistic about this.

It is understandable for some to reckon that widening the range of technology available to individuals may increase the disparity between the rich and the poor, but this view would be somewhat too static. I would never be reluctant to approve that almost all types of new technology are only initially available to the privileged ones, the upper class if you wish, and this is mainly because the newly invented products or services contain a lot of research costs, and that renders the higher prices. Before being marketized, high-tech goods are always too expensive, affordable only to the rich; what the middle or lower-class can do is just to admire the AI applications, the internet of things, and the driverless vehicles that bring the sci-fi-film-like scenarios to rich people's life, dreaming that one day, they would also live their life like that, and then to return to reality, struggling continuously for their basic daily needs. However, that is just a part of the story. The end of the story is always that those technologies then go to the mass market, lowering down their prices because of the increasing demand and the mass production, becoming affordable to most citizens. There might be some priority to the rich from the outset, but anything that is finally proved essential to life will be popularized anyway; there is no need to retreat to Luddism, rejecting anything that is revolutionizing the world but with some short-term disadvantages.

The unreasonableness listed above, however, doesn't mean that we should be over-optimistic, hoping that the widespread of modern technology usage would counter the gap between the rich and poor. Technology gives rise to the upgrade of life quality, but distance still exists; even if the industrialization and the market-driven economy allow us to have the same mobile phones, the same online commercial cities, as well as the same cloud storage and big data as the upper-class do, and even if we are sharing the airplane, the modern logistic system and the 5G network with those millionaires or even billionaires, these don't become the indicators of us being closer to the rich; the disparity is still everywhere. The privileged class doesn't display the priority in the daily needs, but whenever there is an emergency, be it natural disasters or epidemic, or whenever resources are scarce, we could see how they could get more access to the material supplies, more advanced

security system, or round-the-clock caretaking. We are indeed living a better life thanks to the advent of modern technology, using which economic or social development speed up, but that only gives rise to the increase of the overall economy, not the inner distribution; the largest proportion of fortune still goes where it used to go, and that is, unfortunately, to the superrich.

In conclusion, we shall not worry about the proposed enlarged wealth gap because of the range of technology one could get access, but it is also unrealistic for us to count on technology to shorten the distance between the rich and the poor.

利弊类 太空旅游的影响

Space travel has been possible for some time. Some people think space tourism would develop in the future. Do you think space tourism is a positive or negative development?

范文:

Space tourism has always been a fascinating thing for humans. Just like the other tourisms like ecotourism, medical tourism, sports tourism, business tourism, etc., space tourism has become successful in gaining the attention of people worldwide. However, whether it will be a boon or ban in the future has caused a heated debate. In my opinion, there are both positives and negatives.

The first benefit is the jobs that the industry is going to provide. To be specific, with more and more companies are taking interest into space tourism, a high number of jobs for the researchers, scientists, explorers, pilots, programmers, operators, and much other support staff will be available in next few years. Also, to make a space tourism business, shuttles, planes, and many other things will be needed. Therefore, the demand for the particular manufacturing unit will be there and so as the related jobs to it.

Another advantage of space tourism is going to be its ability to renew interest in space and space exploration. With renewed interest, financial backing will follow, and that will support further innovation in the industry and space exploration in general. In this case, the space program will help to know whether human life is possible on Mars or not and many other things in the future.

However, this is not a perfect picture. Every space tour involves a significant risk of catastrophic disasters which can result in a loss of human lives. So, the companies have to take care of all the safety concerns and make every prudent step to ensure the safe journey to space, with the extremely hostile environment of the space anything can happen. Moreover, the space industry also creates environmental problems with the launch of space shuttles, satellites, rockets, and other equipment. It also raises the issue of global warming in the world as there are many no recyclable resources used in space tourism programs.

To conclude, whether to develop the space tourism depends on how we see it and how the industry handles it. If the missions are carried with extreme precautions of safety and other standards, then it will generate a lot of advantages. On the other hand, if it will be held only for the fundraising and just for the pleasure of the eyes to see the universe, then it may end up with the wrong outcome.

利弊类 去偏远地区旅游

It is now possible for scientists and tourists to travel to remote natural environments, such as the South Pole. Do you think the advantages of this development outweigh the disadvantages?

范文:

Prompted by breakthrough of technology, including transportation and telecommunication, the prosperity of tourism has created colossal economic rewards, and this tendency has no sign to cease its steps. Recently, the antenna of this industry has extended into remote areas, such as the poles. However, brought by the activities of scientists and tourists, those natural habitats and ecosystem have been encroached and invaded. So, in my opinion, the demerits outstrip the merits.

It is undeniable that this kind of tourism, for example the polar cruising which has been prevailing for the recent years have stimulate the tourism industry. Guests are increasingly hopping aboard the ships and expect a first-class experience along with elegant menus, comfortable rooms and additional activities such as diving during the cruise. This makes the ship become bigger to accommodate rising demand and makes cruise more profitable.

However, with the increasing number of tourists visiting those places yearly, the cruise also raises the chance of a catastrophe such as oil spill or a sewage leak that would damage the pristine polar environment. This fragile environment is prone to be damaged when human activities influence the local ecosystem. For example, the throwaway products and wasted living material which are tossed away may influence the local ocean ecosystem when ships traverse the Arctic Ocean. Even worse, increased human activity in the Arctic may affect the climate change and inevitably increase the temperature which leads to the melting glaciers and iceberg.

As conclusion, it is worried that human activity is threatening the fragile environment in polar areas and other remote areas which are vulnerable. It is a matter of time, not a matter of if. So, the only thing we can do is to reduce the influence on receding ice and rising sea level and protect the pristine area of our planet.

利弊类 去边远地区旅游对当地影响

Organizing tours to remote places and communities is becoming more and more popular. Is it a positive or negative development for the local people and environment?

范文:

Travel has existed since the beginning of time, when primitive men set out, traversing great distances for food and clothing, for the possibility of finding a better habitat. Tourism in the mass form as we know it today is a distinctly twenty-century phenomenon; it usually means the major new industry that both provides opportunities but also becomes the concerns of many world governments.

Opinions vary largely among people regarding what the popularity of touring to remote places and communities could bring to the local people. Advocators see this as an employment opportunity and a means of producing immediate benefits; as one of the largest segments of the tertiary industry, tourism activates a chain of economic measures including the value-added capital investment, employment, and tax contributions. There are also people holding that its economic impact may be uncertain and the tours are constantly interrupting the daily life of local people. The industries that seemingly prosper because of tourism in those places, like the food services or the accommodations also serve the residents, which makes it difficult to develop any type of reliable or credible information to estimate the contributions tourism has made to remote places and residents. But visitors truly become a problem, notably when the inhabitants find themselves fully occupied by the outsiders everywhere; they are reluctant to see so many strangers in public places, shops, restaurants or even, their front gates.

However, people may easily reach a consensus on the profound negative effects of tourism on the environment of the local communities; they are consistently worrying about the ecological damage due to a wide range of tourism activities. Once the regions, especially those fragile ones, are reconstructed into tourist resorts, conflicts emerge between the natural resources and the invasion of modern facilities: forests may have to give way to the construction of mountain hotels; rivers may be forced to reroute for the water communication. That is truly not the whole story until people have found that the traditional survival system faces challenges in certain remote places which rely their living on the primary industry—it is obvious what people would opt to do after knowing they can earn more in a few weeks working as porters for visitors than in a year working in the fields; farmlands may probably lay waste. This is also considered as one possible reason for desertification.

While the environment of some remote places would be negatively affected, I would consider tourism as a contributive way of changing the lives of local people. Those regions prosper when they

are widely known by others who are willing to pay for seeing what is novel in a particular location. As a proper way, most visits respect the cultures and traditions of the locals, and the former surely provides a scope for the latter to develop by propagandizing it to the public.

公众号：雅思情报圈

双边类 旅游让文化传统保存还是被破坏

Some people think that cultural traditions will be destroyed when they are used as money-making machines aimed at tourists, other people believe that it is the only way to save such conditions in the world today. Discuss both views and give your own opinion.

范文:

I would discuss in this essay why some believe the cultural traditions are damaged when they are used for making money from tourists, and how I support that this is the only way of saving these conventions.

There are people holding that traditional cultures and their derivatives may face the fate of extinction when they become tourism-oriented: they reckon that the economic attractiveness would largely make the traditional cultural products deviate from what they are supposed to be, follow the public interests and therefore may somewhat provoke the loss of a part of those traditions. This type of loss is mainly because the craftsmen or practitioners involving in this area are extremely possible to considerably change the nature of the classic conventions in their cultural undertakings in order to pander the need of the tourist market, and gradually abandon the traditions that are not enough favored by the consumers and the commercial market. It is, ergo, not surprising that why such traditions—indigenous ceremonies, eating habits, or handmade or dwelling modes, etc.--which originate from a specific place are not “purely traditional” at all and added with fashion elements once they face the marketing reconstruction to be endowed with the property of attracting tourists.

Whereas the thinking exhibited in the paragraph would somewhat be shallow and this type of tourist orientation would be the most realistic way of saving these cultures. The lifespan of all civilizations follows the positive natural selections; the aforementioned cultural loss happens anyway when some of the conventions are obeyed by few people and cannot fit the living customs of modern society. While those mentioned traditions, however splendid or spectacular, would largely lose their sustainability when without the capability of being merged with other cultures or of being exposed to the public, notably for the vulnerable ones, whose inheritors are somehow in awe of obeying established ways but lean on the modernized civilization. The legacy should be implemented however, and the transformation of tourist facet sounds the best to stimulate the largest quantity of people who used to practice them to turn about, to pass the traditions down to their descendants and, most importantly, to let the world known them and be willing to accept most of them.

In conclusion, it may be reasonable for some to suspect that the tourist-oriented economy may bring about catastrophe to some cultural traditions, but it is still the best way to sustain their lifespan scientifically.

观点类 负责任的游客

In recent years, 'responsible tourists' have paid attention to preserving both culture and environment of the places they visit. However, some people say that it is impossible to be a 'responsible tourists'. To what extent do you agree or disagree?

范文:

Prosperity of tourism has coined a new term 'responsible tourists', who are encouraged to respect local culture and environment. Although there always exist conflicts between different cultures, it is possible for tourists to be responsible for host culture and local environment.

To begin with, as a law-abiding citizen, a tourist must obey laws and regulations, when entering into local tourists' attractions. Some illegal behaviors, like damaging cultural relics, will be prohibited and punished no matter where he or she live or stay. So, it is common and non-debatable that every tourist knows local laws and regulations as he or she does in his or her own country.

Besides, it is assumed that the main purpose of tourism is to release tourists from heavy burden in daily work, and therefore, it is no need to concern about his or her behaviors even there is limitation or taboo in local customs. However, freedom will not come until tourists recognized the importance of respecting local customs and festivals. Wearing traditional clothes, enjoying local foods and speaking dialects, may receive more social appreciation and respect, which is the best way to relaxing themselves.

In addition, many tourists are flooding into local tourists attractions and markets will inevitably have negative impacts on local living. However, tourists should not be blamed for purchasing most of goods in local market. There is a trade barrier between the two countries, which leads to this social chaos. So, more emphasizing upon balance of international trade and limiting quotas of specific goods can be the solution to this problem.

In a nutshell, a tourist needs to be responsible for what he or she has done in tourists' attractions because this reflects tourists' quality of their own country. And host country will welcome all responsible tourists and promote development of tourism.

观点类 国际旅游导致冲突

Nowadays, international tourism is the biggest industry in the world. Unfortunately, international tourism creates tension rather than understanding between people from different cultures. To what extent do you agree or disagree?

范文:

Recent decades have witnessed the flourish in global traveling and it has become a lifestyle for the normal people. Some contend that this trend has caused tension between different cultures rather than enhancement of understanding, but I find such opinion flawed and hard to justify.

Admittedly, international tourism seems to bring some misunderstanding between local populace and foreign travelers. For example, many people believe that the tourism have aggravated or spoil the visited locations the due to pollution and littering. However, it seems to me that these bad behaviors are not cause by different cultures, but by personal moral principles, and even the locals have these flaws too. Meanwhile, with close supervision and rigid regulations, these issues can be strategically addressed.

Therefore, I personally believe that the international tourism should be promoted because of its enormous benefits, especially the aspect related to then enhancement of understanding of diverse cultures. First of all, this kind of tourism can certainly make travelers to get the firsthand experience. As the language is an essential tool of communication, traveling abroad help people improve language proficiency and increase their knowledge of another culture and people. It is not rare that travelers fall in love with the culture of the host country and work later as cultural ambassadors. Besides, international tourism eases tension between people of different cultures by improving multicultural communication. In other words, although reading as a second hand information source may partially ease the misunderstanding among different countries, we find it confusing to interpret or complying with diverging cultural norms without experiencing cultural nuisances on a first hand basis. Luckily, traveling gives people a good solution by the means of accessing a different land.

In conclusion, international tourism connects people in various countries rather than separating them. Far from causing tension, international tourism improves people's relationship from different cultures.

报告类 国际旅游带来偏见

International travel sometimes makes people more prejudiced rather than broad-minded. Explain why it cannot bring benefits to those visitors. What can people do to improve their understanding of the countries they visit?

范文:

With the considerable social advances, traveling from one country to another becomes very prevalent, and there are many people who are in favor of exploring other countries and feel the sense of freshness so as to broaden their horizons, meet more people from different ethnic groups and acquire the languages and cultures of other countries. However, sometimes international travel makes people more prejudiced, and culture shock and stereotypes are the two culprits that may contribute to the problem.

First of all, historical differences and culture shock are probably the main culprits of the misunderstandings and even discrimination. For instance, in some parts of China, eating dog is allowed and popular, while in Europe, killing or hunting dogs are illegal. This can be seen as a culture shock and some visitors cannot understand, so sometimes conflicts may occur between the visitors and inhabitants. In addition to this, stereotypes account for the appearance of culture prejudice. This is largely due to the fact that many visitors are lack of a profound and comprehensive understanding of the places before setting off, and in the face of the backward situation of individual areas and the bad behaviors of individuals, the tourists may have the tendency to exaggerate them into the stereotype of the whole country, which is extremely difficult to change later as the first impression sets a framework from which people interpret everything else.

Several methods can be adopted to help the foreign visitors to recognize the country in an objective way. First, before traveling, tourists should make sufficient investigation to understand the customs and habits of the tourist area and pay special attention to the precautions, and during travel they should accept and respect the customs and habits of local people so as to avoid unnecessary misunderstanding and conflict caused by cultural differences. Also, several methods should be taken by the local government and the tour guide. The government should popularize the local cultures and histories through Internet and media, which is feasible to let the tour guide tell the visitors the travel taboo and study how to get along with the locals of this country before travelling.

In conclusion, it is no an easy task to eliminate the possible conflict and prejudiced before the visitors explore some popular destination, but I believe that we can iron out the hostility of some visitors in the near future. Actually, the prepared traveller can always enjoy an unforgettable trip.

双边类 出国旅游是否有必要

Some people think that it is necessary to travel abroad to learn about other countries, while other people think that it is not necessary to travel abroad because all the information can be seen on TV and the Internet. Discuss both views and give your opinion.

范文:

It is quite common these days for people to travel internationally to improve understanding of other countries. However, some people argue that there will be no need to get to foreign countries considering all the information is widely available on TV or Internet.

Admittedly, knowledge gained from on TV and Internet features a wider range than that gained from travelling. Abundant information can be available from a variety of sources ranging from documentaries and other tourism programs produced by professional broadcast companies to travel stories, adventures and images from avid travelers. In comparison, what people experience is probably incomplete and partial, sometimes lopsided. Besides, by watching TV and browsing through pages online people can form a general conception of a country with the least effort in terms of time and expense.

In spite of that, I believe that traveling still has much of a role to play in people's life where online information can never reach a comparable level. Traveling physically, which involves all the senses, allows people to have a more firsthand experience and in-depth insight of the local scenery and cultural heritage. For example, apart from having a general idea of a country, people can engage themselves in all sorts of activities such as basking at the beach, interacting with the locals in-person, strolling the streets of a historic city or having a taste of the local cuisine.

In conclusion, I think the importance of traveling around cannot be denied. It is no secret, even less highfaluting talk; traveling abroad has much more to offer which are beyond the reach of simply sitting in front of the screen.

媒体类

混合类 记者可信度

Nowadays, we rely on news for our knowledge, but we are uncertain about the truth of news. Should we believe journalists? What qualities should a good journalist or correspondent have?

范文:

News and newspapers are an indispensable part of our everyday life because they keep us connected with the outside world. This essay shall discuss whether or not we should believe the journalists and also explain the characteristics of a good journalist.

On the one hand, journalists are the only source of information and they indeed provide great service to the public with their talent and hard work. They make residents feel part of this global village by keeping them in touch with it. Sometimes they can even disclose the social problems and provide justice. On the other hand, we should take the information with a pinch of salt as they are likely to spread ill-founded news so as to attract public's attention. Apart from that, news content occasionally is pre-set and modified based on journalists' subjective views. In China, for example, journalists may hide the truth when high-profile people commit crimes such as rapes.

A good journalist should have many qualities. First of all, there is a need for bold journalists, unafraid to present the truth. Sometimes the truth is unsavory or damaging, but despite that, the truth is still paramount. Nothing should be hidden because of self-interest or bias because there is a responsibility to the public to show transparency. Furthermore, credibility and expertise are needed for a good journalist. With advancements in technology, the dissemination of information is instantaneous and coming from innumerable sources, some without much confirmation of credibility. We need good journalists in society to interpret the vast amounts of available information, understand the context and importance, and sift through the information to determine source integrity.

In conclusion, I believe that we can choose to trust the journalists because they bring us the latest news ranging from entertainment to current affairs. Good journalists are those with integrity, responsibility and expertise.

报告可 新闻媒体的重要性

News media are important in modern society. Why are they so important? Are their influences generally positive or negative?

范文:

For decades, news media has been a regular part of our lives and the importance of it is growing owing to the great connectivity that exists across the world. Involuntarily, we are exposed to the impact of news media, which in general is positive, although sometimes the contents reported are not necessarily reliable.

The importance of news media lies with its function as the major channel for people to be aware of reality and to make evaluations. The media was created to focus on issues that are important to society based on truth and dignity. To fulfill its obligation, the media employs a number of professional journalists and reporters to uncover news stories or conduct deep investigations so as to keep readers up to date with what is happening and help them understand current events. Furthermore, the widespread of internet facilitates an exploding media system and makes them more far-reaching. As those traditional journalism is supplemented by blogs and social media, we now have access to a variety of sources of instant news, which allow us to view things from different perspectives. And subsequently, the more informed we are, the better conclusions or decisions we reach.

Despite the fact that what is reported by news media is not always to the truth, they still play positive role in general. News media serve as a facility for democracy. They are there to monitor and scrutinize the powerful, to shed light on what is kept in the dark, to challenge postulates and to empower the informed. Also, the news media provide platforms for the voice of the unspoken to be heard, as with the prevalence of media of various forms, people are given the opportunities to share opinions, initiate discussions and ask critical questions in an open arena.

In conclusion, although it is true that news agencies sometimes fail to adopt a neutral manner, they so far provide comparatively the most creditable and concrete information to base our ideas on and facilitate the democratic progress.

观点类 新闻媒体的影响力

News media has become more influential in people's lives. Others believe it is a negative development. To what extent do you agree or disagree.

范文:

The causality may fail to be persuasive between the increasing influence of news media to people and the negatives this trend may bring about, and I would argue in this essay how unreasonable the claim in the prompt is.

For those attributing some bad consequences to the development of news media, they may superficially see the surface instead of the truth hidden behind every negative development. It is true that when people are more capable to learn about news through mass media, they may be more easily affected by the afterward thinking of such information. This is even more obvious when bad news, or the controversial one comes—the news of calamities, crimes or scandals, etc.—from the stream media, or news network, because people can get access to those coverages without too many barriers and may be easily terrified by linking the possibilities of the re-emergence of those contents with their own life, or form their own opinion by leaning towards one side of those controversies, some of which are lack of rationality. The social panic and some extreme public consensus then emerge, and this anti-promotes the supposedly harmonious society into an unsecured way.

Whereas the myopic thinking listed preclude people's ability from seeing past the appearance that leads to those detrimental effects, and robs them of the opportunities to recognize the true cruxes that lie behind. Social phenomena, positive or negative, never come for just one reason, and even if those aforementioned panic or disputes are sourced from the news encountered by the learners, the media is still not the one to blame: it is the information itself that provokes those unfavored reactions, or should I say even there is no such media, or even no news injections, other types of information—rumors, gossips, etc.—would lead people to those worries and public opinions anyway, because they emerge alongside the social community and every word from the narrators within it, but not what medium is involved, or even not whether it is news or not. It is therefore sad to say those considering the increasingly influential news media as the culprit are manifesting their recklessness, because it is not the premise, but just the useful method that helps people distinguish more truths from the chaos of information injections.

In conclusion, I would very much agree that before scrutinizing whether one thing is leading to negative development, one should firstly set up the system of causality that can testify the true reasons lying behind the phenomenon; news media is clearly not that reason.

观点类 新闻媒体对人们生活的影响

Some people think that news media have become much more influential in people's lives today and that this is a negative development. To what extent do you agree or disagree?

范文:

For many people, news is a regular part of life. An issue in dispute is whether the massive influence of the news media on people's daily lives denotes a negative development. In my opinion, news media does more good than harm to the society.

It is undeniable that news media has some negative influence. First of all, the news media exaggerates the magnitude of the real threat such as the potential of a terrorist attack, in order to draw the attention of the desired audiences and in pursuit of high audience ratings. It ends up with causing panic among the population. Meanwhile, the news media tends to emphasize some issues or events, which virtually have little relevance to people's daily lives, such as an occasional multiple vehicle accident, an affair that a celebrity is involved with, and the like. It distracts the audience from something that is much more noteworthy, for instance, poverty, environmental problems, to name but a few.

However, news media also provides people with much of the information they need on a timely basis, allowing people to keep pace with the times and have more topics to talk about. Anecdotal evidence shows that people from all walks of life have the habit of collecting information regularly from the news media, including print, broadcast and Internet-based media. Meanwhile it should be recognized that the news media can sometimes save lives and reduce casualties. There is a lot of uncertainty about the surroundings, and people are susceptible to the damage caused by accidents, crimes and natural calamity. The news media conveys the firsthand information to concerned audiences and enable them to take corresponding actions right away. The authority can declare a state of emergency when it is necessary, organize evacuation and distribute aid to the needy areas. All these efforts count on the news media as the messenger.

In summary, the role of news media as an information provider should be acknowledged. In case of emergency, it acts as a lifesaver. However, it is not to say that the news media can give people an overall view of the problems in society all the time.

观点类 媒体新闻报道消极问题还是积极发展？

There is a tendency that news reports in the media focus on problems and emergencies rather than positive developments. Some people think that it is harmful to the individual and to the society. To what extent do you agree or disagree?

范文：

I would argue how irrational the claim made by the topic is via absurdly linking the media's focus on social problems and emergencies only with the harmful effects on the public and society.

Before scrutinizing whether the coverage from the modern media only focusing on the dark side of the entire society instead of the positive development would be proved injurious, we must see that it is certainly not doable. For any appraisal to be ordered, one should first define the parameters so as to have the system of differentiation. The so-called "harmful" elicited by the argument is highly subjective, and ambiguous enough to be hardly witnessed among both individuals and the social community at large. Just what is termed "harmful" to individuals and social surroundings? No evidence could be provided on whether the information injection can directly or indirectly do harm to their physical conditions: it is hardly far-fetched to figure out that people's health can seldom be plagued, nor can the social advance be precluded just by seeing too much negative news reported on newspapers or televisions; those harms are mainly correlated to the one's body functional disorders, or sometimes the practical damages. Yet mental detriment or the social disvaluing is rather impossible to be measured due to its invisibility and potentiality, because the part of the mental problem, or the pessimistic ideology of society never comes immediately after the reading process—even though there may emerge sorrows or bad moods, how dare we decisively categorize those regular daily reactions into the cohort of "harmfulness"?

The thinking listed in the topic also misleads its voters from the rooted causality between media function and the following consequences it may bring about. Granted, what a news media should do is to objectively deliver what it can see without leaning onto either the brighter or darker side, but it is certainly not the reason to provoking blights to individuals or society that media draws too much eye on the problems or incidents; even if there is any possibility that the so-called "harm"—probably the glumness of individual, the social panic, etc.—emerges, the coverage per se is not to blame, because what really hurts people is the truth itself by whatever means of news achieving. Such logic implies that receivers feel harmful anyway when learning about those problems, no matter what carrier is employed, and the media should never be declared as the culprit of this. Simultaneously, the out-of-balance of the news release also proves no harms, even though criticism calls attention to pessimism this should prove when coverage is without positive property. There certainly are abundances of ways for stream or printed media to be encouraging: optimism and righteous values

have already been and still are injected in movies, publications, and any other types of media products to compensate the negative feeling that virtually comes from the reality.

In conclusion, I would very much agree that news report focuses overwhelmingly on release with negativity is not the reason leading to harmfulness to the public; cruxes should be meticulously measured when we examine the causality.

公众号：雅思情报圈

观点类 媒体应该多报道好新闻

The media should include more stories which report good news. To what extent do you agree or disagree?

范文:

It has been raised by many people that more good news is supposed to be covered through media. Despite the opposite viewpoint I personally hold a supportive position.

First and foremost, bigger proportion of positive media coverage can to some extent weaken the potential “copycat”, or in other words, imitative, crimes and suicides. According to criminologists’ theories, constant appearance of crime events, rather than events including good news, could sometimes give the criminals a fame and thus inspire ordinary people to commit crimes that they otherwise would not think of. That is to say, detailed and widespread negative news report could possibly result in more replicated criminal acts. Hence, more reports that express encouraging messages are necessary given their relieving effect on crime rate.

More importantly, reports on good news promotes social confidence at large. Admittedly, it is a reasonable argument that reports on crimes and accidents can remind people of the dangers and prevent them from being harmed. However, this also exacerbates social isolation among citizens whereas good stories make people think they live in a society where justice, love and equality are valued. In this way, a solid trust in governments, authorities and people around can be established. For example, there would be more people giving up on their guard against strangers and helping them instead of taking other people’s problem as a trap. Only with such confidence can the society continue to operate and a normal life be maintained.

By way of conclusion, more time and space are supposed to be left for good news given its beneficial influence on both crime rate and social confidence.

公众号：雅思情报圈

观点类 不再需要印刷报纸

Some people say there is no need for printing newspapers. To what extent do you agree or disagree?

范文：

Before accessing whether a product is not needed in nowadays society, we may have to find out the exact definition of “need”; it testifies in this essay whether a type of commodity still has uniqueness that it cannot be fully replaced by another.

For those voting the removal of newspapers in current society, they do have confidence to say that most of the functions of newspapers are dwarfed, or at least substituted by new modes of news learning, most of which are easily acquired via portable internet terminals. It may be true that this replacement is inevitable, because many human needs for accessing news are more than just fulfilled during their use of the news apps, internet media on their portable devices—cell phones, laptops and tablet computers, etc.—which have already prevailed among the entire society. Those capacitive or LCD screens bring people new reading experiences; they can gain news, compared with the traditional paper printing media, not just by reading words or static pictures, but also by gaining vocals, GIFs or even videos. This is definitely more concretized than those conventional, plain expressions on newspapers, without mentioning that the printing means is extremely limited in timeslot of the news release: after all, it takes time from printing out publications to delivering and handing out them to customers, but this type of sunk costs is saved by the cyber way.

Whereas the thinking exhibited in the paragraph would sound relatively myopic, since it doesn't see past the truth hidden in the phenomenon: things that prevail for a long time, always have their own characteristics that cannot fully be inherited or surmounted. Newspapers, even are not as that welcomed by this era, still possess the nature that at least overwhelms other news learning mediums contemporarily. There still exists no internet media, or portable internet methods can integrate news pieces so efficiently and readably as do newspapers, on which information is categorized and published horizontally in columns, with bolded, large titles to illustrate the main points; such releasing pattern is extremely useful for searching swiftly and make gist reading and interest focuses easily. This benefits from the traditional paper printing mode, since it is light and foldable, which permits producers to make it large and easily carried; yet all the modern ways can still not provide such a visual field or folding availability; they may otherwise be heavy or facing technical barriers on the displays.

In conclusion, I would argue that newspapers are still not the fate of being fully dismissed in news market since they are with their unique benefits that cannot be surpassed as that easily by other news applications.

双边类 报纸是最好的新闻渠道

Some people believe that newspaper is the best way to learn about news. While others believe that more effective way is through other media. Discuss both views and give your opinion.

范文:

While some people crown the newspaper as the most important means of reading news, others believe that other platforms have knocked it from its perch. It looks to me that neither opinion illustrates the entire picture and it is therefore simple-minded to venerate one type of media over the other without scrutinizing all determinants.

I have to say that it is simple-minded to label the newspaper as the optimal access to information. Admittedly, before the invention of modern media like the Internet or TV, the print media does play as the dominant source of information, much to the delight of the elderly who usually have enough leisure time to kill. Nevertheless, those think in this way are oblivious to the need of young readers, who live a hectic life in the fast-paced modern society and therefore cannot afford the time and patience to fumble for the news in papers. Given that, unlike their predecessors, the younger generation rely more on computers and smart phones to know what is happening in the world, thanks to the convenience of the portable devices and up-to-minute information updated online.

In spite of the hymns of praise of electronic media, it does not necessarily mean that they are more important than their traditional counterparts in every corner of the world. Electronic media might play the dominant role in metropolises where communication facilities are well developed and the majority of the residents are working adults who marry themselves with computers or smart phones. Unfortunately, this is not the case in impoverished areas, where there are hardly any telecom infrastructures and therefore the people there have no alternative choices but to stick to the traditional newspapers as their only connection to the world.

In conclusion, I believe it is irrational to claim any media as optimal without considering the needs of individuals as well as other extrinsic factors; both newspapers and other media have their roles to play in different conditions.

观点类 报纸依旧是重要的新闻来源

Although more and more people read news on the Internet, newspapers will remain the most important source of news. Do you agree or disagree?

范文:

Although newspapers have long been crowned as a dominant source of information for the general public, I tend to disagree with the assertion that they still hold the reins of media in the age of Internet.

Admittedly, there are some justifications for newspapers, though they limit to some certain aspects. Firstly, to senior citizens who have difficult in dealing with electronic gadgets like computers or smart phones, it is the papers that keep them informed of what is happening in the outside world, allowing the older generation to keep abreast up with the ever-changing world. Also, we should not forget the exclusive value of newspaper clips as an important physical document of historical moments, a character which is by no means to be replaced by their electronic counterparts.

However, plausible though these features are, I have to say that this traditional media form is no longer the most important news source while considering their disadvantages with online media today. The first primary factor worthwhile to mention is efficiency. The world is moving in a direction where most events or breaking news are disseminated almost immediately after they happen via the ubiquitous Internet, meaning that many people cannot afford to wait for the next day newspapers. This is particularly important for politicians and businessmen, who rely on the up-to-minute news to make decisions which may influence the future of a nation or stock market.

Another disadvantage lays emphasis on the cost of reading a newspaper. While there were no other free alternatives, people had no choice but to pay for the coverages printed on paper. Today, when being exposed to various accesses to free news, e.g. Facebook, Instagram, people are less likely to open their wallet to subscribe to the newspapers.

Given the comparison above, I do not think it tenable to claim that newspaper is the most important media in today's world.

报告类 报纸对人们的观点有很大影响

Newspapers have an enormous influence on people's ideas and views. Why? Positive or negative?

范文:

Never has any media played such a significant role in affecting people's thought as the newspaper has done. While various hypotheses have been put forward trying to explain this problem, I would say that the status of the paper can be attributed to 2 aspects and its positive influence upon individuals deserve our attention.

The first reason contributing to the importance of the newspaper is the authoritativeness of its content. Unlike other social media as Facebook or Twitter, where most information is published by anonymous users who are neither responsible nor trustful, the coverages issued in the newspaper are written by professional correspondents, not to mention those profound critics which are sometimes from eminent scholars or researchers in a specific realm, whose opinions are relatively more reliable and have referenced value.

Another factor we should not ignore is the reputation of many newspapers. Compared with other media like TV or the Internet, what makes the paper stand out is its long history. Many famous news agencies can be traced back to several hundred years ago, which is unparalleled by any modern counterparts. Such a feature is particularly influential to senior readers.

When it comes to the effects of the paper, I would say that the guidance from the newspaper is necessary, especially in this age of information explosion. Exposed to numerous information from various sources, people today are more likely to be misled by sensationalized hearsay or gossips from unofficial channels. In this respect, it is the stalwart media like Washington Post and New York Times that help the public distinguish facts from the fanfare. Were it not for their analysis and insight, people would be less likely to establish their objective opinions towards many events and therefore make their decisions.

In conclusion, what contributes to the unique position of the newspaper are its authority and historical reputation, which I believe still have a positive role to play in providing guidance for the majority to form their independent views.

双边类 电视频道是否增加电视节目的选择和质量？

Some people argue that they would have more choices if the number of TV channels increases, but some would think that it would lead to poor TV programme. Discuss both views and give your own opinion.

范文：

As a vital approach to spend leisure time, the topic of whether it is appropriate and effective to increase the quantity of TV shows is of great concern for many people. Some people argue that this means can bring more choices whereas others are worrying about that the quality of the current programs may thus be adversely affected. Personally, I prefer the latter.

First of all, poor TV programs may be exerted from a growing number of TV broadcast stations due to the limited resources and staff. When a new channel runs, there may not be excellent producers and directors who are potent to guarantee content of TV programs. Therefore, rather than just increase the number of channels, it is more crucial to put emphasis on the design and framework of each TV programs, or the government should pay more attention to cultivate more related talents.

Besides, the expansion of TV programs may also lead to the phenomenon of duplication. For example, some programs which focus on latest news may report the similar information when emergency happens even if they are created by different journalist. Meanwhile, even other channels aim at providing entertainment for audience, there also exist the cribbing or simulation of the popular programs abroad so as to expand the readership. However, with the advent of the Internet, people may have already accessed these TV shows online before the local channel broadcast the similar programs on TV, which means that the choices of audiences may not actually upgraded.

Theoretically, increasing the number of channels may make audiences' life more culturally and socially diversified, as watching TV used to be one of the main means to spend their leisure time. However, as I mentioned above, the advances of the network have already brought about the prosperity of the online programs, which can also contain the recreation value for the people nowadays.

In conclusion, it seems to me that the increasing number of TV channels cannot provide more choices for people but minimize the quality of each programs mainly because of limited sources as well as the duplication which may happen when news and popular program emerge.

双边类 广告的好处和坏处

Some people think that advertising may have positive economic effects. Others think it has negative social effects because individuals are not satisfied with who they are and what they have. Discuss both views and give your opinion.

范文:

No one can deny the fact that advertising, whether it be commercial or public, has changed both individuals and society. The changes brought by advertising are, in my opinion, generally more negative than positive.

One positive change would be the growth of economy because advertising, as the most frequently used method to deliver information to customers by commercial entities, never fail to brainwash audiences and therefore promote and encourage consumption. For example, many female consumers in China, exposed daily to the commercial advertisements circulated on the internet, believe that black leggings are the symbol of fashion and then bulk purchase them via Taobao, the Chinese equivalent of Amazon. What this mean is that clothing manufacturers will keep their production lines running 24 hours a day to meet the increasing demand of their clients, thereby resulting in higher profit.

However, advertising is to blame for advocating an extravagant lifestyle by creating excessive needs, regardless of the potential negative impacts on the community. It is human nature that people often seek a sense of superiority from having what others do not have. Although they do not really need these things, they may still, lured by elaborately produced advertisements, waste their money on them, and, in extreme cases, borrow an enormous sum from banks to satisfy their superficial desires. Alarmingly, this also includes our next generation: teenagers and children in poorer families who are not supposed to waste money or incur debts.

Unfortunately, in this time and age, our will to resist Satan's temptation is often compromised by our ever-growing desires. Therefore, I strongly believe that measures must be taken to minimize its negative social impacts.

利弊类 广告影响人们的生活

People are surrounded by many kinds of advertisement which can influence their life. Does the positive effect of this trend outweigh the negative effects?

范文:

Various kinds of advertising are ubiquitous in our present society. Some people think these advertising inundates, and they exert detrimental effects on our lives. Personally, I cannot fully agree with this opinion.

It is true that the massive commercials around us cause some problems. Firstly, the advertisement penetrated almost every corner of people's lives can be very annoying. For example, we often have to watch the commercials before or during enjoying a video, it would be such a bummer especially when we are totally engaged in the plot. Besides, some commercials tend to exaggerate its effects or even provide false information of their products to lure consumers. It may affect the customers' shopping experience as well.

However, I am of the opinion that advertisements benefit our lives to some degree. To begin with, advertisement often highlight the superiorities about the corresponding products, so they play an active role in disseminating information about the products. Therefore, the time customers spent on selecting could be greatly reduced. In addition, some advertisements are of great aesthetics value. Those elaborate advertisements with fantastic pictures and music can be a visual feast for us to enjoy. More favourably, some public advertisement could send out some righteous social values like respecting others and staying away from gambling and drugs. Hence, they may help create a more harmonious society, and our inner satisfaction could also be enhanced.

In conclusion, I believe advertising should be embraced in our society although we need to try to avoid its potential drawbacks to make it more beneficial for our lives.

公众号：雅思情报圈

观点类 广告影响了重要性认识，并有消极影响

People nowadays are surrounded by all kinds of advertising. Advertising affects what people think is important and it has a negative influence on people's lives. To what extent do you agree or disagree?

范文:

I am an advocate to the opinion that the advertisements are affecting people's values, but to say they have negative effects on people's life would sound irrational.

It is widely agreed that drumbeating are gradually misleading people. The core of advertising is to promote sales, which means that they need to, sometimes, boast the selling points even if they are just the auxiliary functions instead of the major capability of a product. The commercial of a mobile phone commercial, for example, would spend most of its description on the powerful capacity of the camera, but without saying a word on the aspect of the signal connections. So do the other types of advertisement which focus on delivering a new concept of promotion. This would lead their customers to a misguided path running counter to their original aims of purchasing. In addition, the promoting means adopted by the advertisings are making the consumers not focus on the commodity itself but prompt to who stands for it. Superstars, or other public figures, would be invited by the producers, say, to speak for their products, provoking a huge purchasing from their fans or advocaters, who pay attention to the relations with the idols rather than the true value of their buying.

Whereas the topic claiming that advertising may be negatively linked with people's lives may somewhat be myopic without seeing the true essence of the whole thing. Before scrutinizing the opinion, one must first define the parameter so as to clearly differentiate the so called "negative influence" of advertisement from what is truly adversely impacting our lives. For those absurdly pointing out that the over-surrounding, repetitive advertising is distracting us from the programs or visual incomes, or sometimes annoying, I have to argue that it is not what advertisement has brought us, but the repeating property of stream media per se. The truly tiring feeling comes from any repetitive visual information; advertisement is surely not the only culprit behind this. Many may then connect the aforementioned misleading value with the bad consequence that people may purchase on what they do not realistically need, but this also is weak due to the lack of looking at the root of the problem. What practically makes the product somehow meaningless is the commercial goods that fail to embody their shining properties by simultaneously fulfill their originally basic needs of their consumers; to simply blame all those unsatisfied purchasing experiences on advertising is relatively simple-minded.

In conclusion, advertisements do occasionally have mis-valued functions to their learners, but they really do not have the capacity of adversely influencing them—the truth of what is the rooted reason for the negative impacts should be clearly witnessed.

观点类 广告鼓励人们大量买东西

Advertising encourages people to buy in quantity rather than promoting its quality. To what extent do you agree or disagree?

范文：

Advertisement has always been a crucial part in the world of marketing, and we have seen a significant increase in the amount of advertisements, whether it is on the media like television or widespread through social network platforms. However, there are some people who argue that the function of advertising is only reflected in the improvement of the sales volume rather than the optimization of the quality of goods. Personally, I believe this idea is reasonable to some extent.

The reason why advertisement only help the mass selling is because the essence of advertisement is not to enhance the quality, but rather to expand the market and enhance the popularity. In other words, the tactics placed in the messages, such as showing people having a good time together when using a particular product, using bandwagon, showing only the upsides of usage, and applying compare and contrast strategies to show the effects of using the product, make the products stand out and let consumer more recognize their products and have the desire to purchase. Even if people do not know it, these messages are repeated several times and soon it may brainwash people to finally go out and get the product. All these advertising designs are only related to marketing, not to product quality.

Admittedly, the advertising strategy to increase popular consumption is likely to result in incompetence since nothing else than the product itself constitutes quality. It is because that hypnotized by the advertising initially, consumers will refuse to buy again and shared the unfavorable experience online if the product quality is not consistent with the advertising, resulting in a plummet in sales eventually. This phenomenon is particularly prominent in today's Internet era. Therefore, for the products with huge investment in advertising, manufacturers generally pay more attention to the quality of such products in order to ensure long-term profits. However, this is only a hypothesis, and the reality is that in order to attract more buyers, the content in the advertisement may be exaggerated, and even some may contain fraud information.

In conclusion, it seems to me that the outcome of advertisement mainly focus on the sales rather than quality. However, for the long-term profits, advertisements must be designed and presented in the correct way to result in the highest effectiveness.

双边类 广告商以孩子为目标

There is an increasing amount of advertising directed at children which encourages them to buy goods such as toys and snacks. Many parents are worried that these advertisements put too much pressure on children, while some advertisements claim that they provide useful information to children. Discuss both views and give your opinion.

范文:

Over the years, there has been a dramatic increase in the number of ads targeting children because the advertisers are aware that kids are the center of nuclear families. As a result, many parents are worried about this phenomenon. However, some advertisers claim that they provide beneficial information to children.

Admittedly, in sensitive areas such as the toy industry, some censorship should be there to limit children's access to excessive advertisement as children under a certain age lack ability to make wise judgment as to what they really want. They are attracted by colorful pictures on advertisement and swayed by misleading information. So they pester their parents to buy those things and this can upset the budget of many families. Even the advertisements of fast foods are detrimental to children. This is because children tend to believe that the slim model eats the food he/she endorses and is still so fit. Some of them even believe that eating such food will help them acquire the shape of the model.

On the other hand, advertisements provide necessary information to the children. For instance, the advert of Colgate toothpaste, which tells us to brush our teeth twice daily, is good for children. Then there are some ads about education like Byju's learning application, which help children to improve their academic score and learn their subjects with better illustrations. Moreover, some advertisements also highlight the importance of saving water and electricity, keeping our surroundings clean and planting trees. Children are motivated by these ads and try to follow them.

To conclude, it is imperative that regulations be imposed on advertisers which make false claims. However, advertisement is indispensable in this highly competitive market and produces much more positive effects than negative ones to the society as a whole.

范文 2:

The advertisement is the predominant promotional approach being used in almost every industry to get noticed by their prospective customer. These advertisements are also playing their part in influencing young minds in particular. Although advertisements in themselves are not bad, I

personally believe that people still need to be critical and aware of what to avoid in certain aspects of advertising.

Admittedly, advertisements do perform an important role in the promotion of products and services so that people will become aware of them, but in righteous and unrighteous direction. In today's society, many industries are faced with an ongoing ethical dilemma because they are far more concerned with making money than providing good, safe and healthy product for consumers. It is not uncommon for some advertisers be held responsible along with the producer of false or inferior products. The biggest victims in this marketing scheme are children, as for example, most snack geared towards children are unhealthy, processed food that are high in sugar and low in vitamin and other nutritional content. The toys advertised are usually addictive or some of them are discovered later to contain toxic chemicals in the choice of material or paint.

On the other hand, as many parents have concerned, children do bear the burnt from the prevalence advertisement either consciously or unconsciously. The world as we know it is consumed by advertising. Our eyes are continually be exposed to various form of advertising such as televisions, media, magazines, bill boards and even school buses. These advertisements are brain washing the younger generation into the urge for impulsive buying. Worse still, as in most cases, children are losing the ability to live a life without materialistic joy.

They will fall into the habit of paying a considerable open income or spending family cash easily, which will contribute to the pressure for the children themselves as well as their parents.

In conclusion, children are the least informed and most influenced of all potential consumers, so that we need to be careful about the amount and content of the advertisement towards them.

公众号：雅思情报圈

观点类 针对儿童的广告是否该被禁止

Nowadays a large amount of advertising aiming at children should be banned because of the negative effects. To what extent do you agree or disagree?

范文:

People today are often exposed to a variety of advertisements on cell phones, in newspapers or on the subways, part of which are children-oriented. Some argue that they should be prohibited due to the potential negative influences. However, I partially agree with this action.

Sure enough, overexposure to advertisings is likely to exert a heavy burden on children as well as their parents both physically and economically. The advertisers usually have a deep insight into children's psychology and behavior, and they are designed to be more appealing to children's minds, whether fancy toys, fast food or some other commodities. As a result, some innocent children do not consider the nutrition of some fast food and the potential physical damage. Instead, they are more likely to fall prey to its delicious taste and may even pester their parents to buy whatever is advertised as long as they expect, regardless of the price and the function.

It is, however, rather groundless to simply say that all advertisements aiming at children should be banned. The function of advertisement is to disseminate information and encourage people to make better decisions. This is true to a certain extent. In some cases, parents tend to choose the high quality products which are helpful to children's study according to what a commercial introduces including stationery and books, especially after careful comparison. However, the fact is that commercial advertisements concerning almost every aspect are usually exaggerated by advertisers for certain purposes, a consequence that consumers are not truly informed. Therefore, careful consideration is of great significance before making purchasing decisions.

In conclusion, I believe that advertisings targeted at children should be strictly regulated by the related authorities and institutions because children are prone to be affected. Nevertheless, it is not necessary enough to ban all of them.

观点类 食品广告应该被禁止吗？

Research shows that overeating can be just as harmful as smoking. Thus the advertising of certain food products should be banned, as cigar is banned in many countries. Do you agree or disagree?

范文：

People are bombarded with food advertisements every day and this is possibly why they have a strong appetite for some food products such as fast food and snacks. Personally, I believe imposing a ban on these advertisements can be a solution, but this is too narrow an approach.

Banning food advertising may reduce the number of overeaters to some extent. These advertisements normally promote the message that people can find enjoyment in eating some kinds of food. For example, fast food, which is normally full of fat and sugar, looks delicious on television advertisements, and advertisers also invite some celebrities to endorse some fast food brands. Consumers who look up to these high-profile figures tend to eat more than they need. This is why food-related advertising should be censored.

On the other hand, regulating food advertising, instead of changing consumers' dietary habits, is possibly not effective. This is because many eaters are not able to show self-constraint and overconsumption of unhealthy food remains a problem. Food producers have also selected ingredients carefully to ensure that hamburgers, sweets and chocolate bars are tasty and addictive. Because of this, unless governments can impose a tax or enforce food labeling laws, eliminating food advertisements alone cannot stop consumers from overeating.

Another solution is to launch awareness campaigns, which can educate the public about the negative consequences of binge eating, in contrast to banning advertisements on all food products. Consumers should be aware that they can become overweight and prone to other health problems, if they do not control their appetite. They tend to become unsociable and inactive because they are less confident in their appearance. Fearful of these consequences, they will pay attention to healthy eating and only eat food in moderation.

In conclusion, tightening the control over food advertising may help change some consumers' eating habits, but this should be combined with other approaches to deter people from overeating.

观点类 社交媒体的利弊

Many people believe that social networking sites (like Facebook) have had a negative impact on individuals and society. To what extent do you agree or disagree with this statement?

范文:

Social media have become an indispensable part of a majority of people in contemporary society. However, the debate about whether social networking websites would trigger adverse influence on us never seems to end. In my opinion, it is beneficial for us as long as we know how to use it reasonably.

Social networking websites bring unprecedented conveniences to our lives. To begin with, we can keep in touch with our friends or relatives instantly anytime and anywhere. By sharing words, pictures or videos, we can have more interactions with them regardless of geographical distance. Apart from this, social network also can expand the approaches that we make new friends. People can easily find people who share similar interests with them. For example, social websites like Facebook and Twitter provide various groups of different areas for people to participate in, so they are able to share information or collaborate with others in an easier way. In addition, since the social networks can release information effectively and efficiently, they are now widely used by governments or other officials to inform the public of the latest notices.

However, it is note-worthy that social media also have some potential drawbacks. For instance, people's face-to-face communication skills will reduce dramatically if people indulge themselves in the virtual world; the risks of leaking personal information also cannot be ignored since we often post our true information and location on these social media.

To sum up, I suppose that the social media brings more benefits to both the society and individuals as a whole despite the potential threats if we do not use them wisely.

社会类

利弊类 独居或小家庭取代大家庭

In many countries today, people in cities either live alone or in small family units, rather than in large, extended family groups. Is this a positive or negative trend?

范文:

Before scrutinizing whether living independently or inside a limited family range would bring about outweighing benefits or problems compared with the life in an extended community, one must first define the parameters so as to have a system of differentiation; development may appear diversely in individual lives.

Indeed, positives emerge when one chooses to live alone or starts a family with a small range of members, especially in the modern urban life, where persons are increasingly lacking of time and energy to maintain a traditional and relatively stable living. That is to say, solitaries, or nuclear families definitely enjoy more freedom than the great family groups; they are designing and arranging their family livings dynamically based on their own purposes (or at most their couples' and children's) without caring about other dependents or close relatives. Fitness of this living style, ergo, is manifest among urban residents who are occupied always in their ever-changing living, socializing and working conditions. It is also a saving of vigor that no complicated family ties are binding persons living on their own or in small families: no need for one to concern about whether one should be closer or relatively distant on forming their relations with a relative; no pressure or guilty is sensed if one wants to be indolent so as to do nothing after going back home. Energy and time are therefore used more reasonably for people devoting more into their careers or studies in today's city on what they should focus more on.

Situations sometimes go adversely, however, if solitude or minute family structure is adopted instead of kinship ones by those without well-rounded abilities to manage the real-life details or struggling with life under financial burdens. Flexibility of a family life may also provoke instability and irregularity to the members—they somewhat need to acquire more capabilities to face problems and to undertake more ventures when there are only restricted holders within a domestic environment. Disorders are more likely to happen in this circumstance once there is emergency; no additional one would help to deal with issues overwhelming the whole family. Economic pressures may also prevail when fewer individuals have to weave everything into the fabrics of the entire household. Notwithstanding lower costs that are involved in feeding the members, increased expenditures on ranging from housing to instruments, which are far higher than consumptions on daily intakes, necessarily needed in the daily routines mostly are covered solely by a particular person of couple,

rather than shared by distributed users under a sharing roof; hardships may even overmatch happiness among dwellers in highly evolving cities.

In conclusion, I would very much agree that the balance of edges and weaknesses are highly recommended by integrating individual properties and visual angles in dialectically seeing the current family life; situations vary greatly between people chasing for family maneuverability together with simpler interpersonal relations and the one hardly handling their lives or caring more about monetary family operation.

公众号：雅思情报圈

观点类 越来越多的人选择独立居住的原因？

Recent years, more and more people choose to live by themselves. Why is the case? Is it positive or negative for the development of the society?

范文：

Currently, it is not uncommon that an increasing number of people prefer to live alone. From my point of view, several reasons are responsible for this phenomenon with more negative effects in terms of the social level.

The first main factor is the pursuit of freedom and privacy. Young adults, nowadays, prefer independent lifestyle than ever before. In other words, they are not willing to be restricted by family bond or marriage, a consequence that solitary lifestyle satisfies their needs and becomes their favourable choice. Another reason contributing to this issue is that some youngsters choose metropolitans as their destinations to seek employment. This behaviour means that they have to be separated from their parents and live by themselves due to the geographical limitation.

Although this lifestyle is popular among young people and bring them certain benefits, the detrimental influences on society arising from it can never be ignored. The trend of living independently accelerates the demands of housing. Therefore, the pressure of housing shortage will gradually become a serious issue for authorities to handle. From another angle, becoming accustomed to living alone is more likely to form introverted and egoistic characters since those people have no one to communicate with at home when encountering some problems or feeling frustrated. Nevertheless, only with extroverted personality and teamwork spirit can people integrate into work and society better and smoothly.

In conclusion, the tendency of living alone is inevitable but we are supposed to take the above demerits into account and lay more emphasis on family life and personal development.

公众号：雅思情报圈

观点类 快速改变的生活方式影响家庭关系

Some people think the lifestyles changing rapidly has affecting their family relationships. The advantages are outweighing the disadvantages. Give your opinion.

范文:

In this day and age, people have dramatically changed the way they live, which in turn affects their family relationships. Personally, I think this tendency comes with both positive and negative effects.

On the one hand, changing lifestyles bring about various positive impacts on family connections. Firstly, thanks to developments in technology, devices such as smart phones, tablets and laptop computers have not only become an indispensable part of our lives but have also helped to make communicating with our friends and families much easier, particularly between those who are separated by long distances. A case in point is that suppose if a girl goes to work in a foreign nation, she still can keep in touch with her parents by using Skype for video calls anytime whether it is day and night. As a result, technology helps to keep the bond stronger with the family members. Secondly, people are paying more attention to their well-being nowadays, and therefore family members tend to go to fitness centers together to lead healthier lifestyles, which will help to bridge the generation gap and promote better communication between family members.

On the other hand, changes in lifestyles also have their downsides when it comes to family relationships. To begin with, the overuse of such technological devices mentioned above, can also hurt family relationships. For example, if family members become too immersed in using their devices for individual recreational purposes, like checking their social media accounts or browsing their favourite websites, they may neglect their relationships with other family members. Consequently, the amount of quality time that a family spends together is likely to reduce, negatively impacting family relations. Furthermore, these days, people are becoming more and more career-oriented and are subsequently losing the balance between work and family life. In fact, it has become more common that family members are less available at home, even outside of official working time, leading to weakened family interactions.

In conclusion, while some changes in lifestyle are advantageous to family relationships, the opposite is true for other changes.

报告类 家人聚餐变少

The tradition of eating meals with families together is disappearing. Why? What effects on the family and society?

范文:

Traditionally, people preferred to eat with their members almost everyday, but now the situation has been altered and this tradition is vanishing. It seems to me that the acceleration life module and diversification of catering services are the two main reasons for this change, with several impacts on both households and the community as a whole.

First of all, the hectic work schedule is often considered the main reason why individuals cannot have meals with their family. Under the circumstance of fierce competition especially in metropolitan cities, people have no choice but to devote themselves to their career, by which I mean most of time would be spent at work rather than at home and they even have no time to meet their family let alone have meals together. Another contributing factor is that the catering services have been diversified, offering more options for people to choose from. For example, culinary skills are no longer crucial to younger generations as the takeout restaurants are peppered with their life, from which people can ordered almost anything they want, receive the food in a shorter time compared with the home working and even don't have to both the tableware cleaning. Therefore, eating at home with family is no longer a must as it used to be.

Admittedly, the gradual disappearance of family meals has several influences. In terms of individuals themselves, this would inevitably exert the alternation among family members. It is because that the family togetherness is a valuable opportunity to exchange emotions and share daily stories, which contributes to the strengthen of bond with each other. Without this, family values might not be appreciated when people do not feel the need to come back home. Besides, regarding to the social impact of this phenomenon, this may somehow lead to the ignorance of traditional cultures. For example, parents would teach their children to behave in a socially acceptable way, like avoid stabbing the chopsticks in the bowl of rice as with any Buddhist culture such behavior what happens at a funeral. Otherwise, people would offend the host especially in the formal dinner or other occasions without consciousness.

In conclusion, there are many reasons which prevent families from eating together, most of which stemming from the family members themselves. And it is clear that such lack of quality time with family can have negative impacts on individuals themselves and the society.

利弊类 家人一起出国的利弊

Many parents in these days work in other countries, taking their families with them. Do you think advantages of the development outweigh its disadvantages?

范文:

In spite of the fact that a growing number of adults migrated abroad to find better occupations, they also decided to take their family to accompany them. Some people believe this decision is quite reasonable, whereas others raise doubts about this. Personally, I believe that the merits overshadow the demerits.

First of all, taking family together with these migrant workers can substantially enhance their family bonding. It is undeniable that parents play an irreplaceable role in the growth of their children, and the elderly need the effective company when growing old. Therefore, such behaviors can largely deal with the above problems. Even in the initial stage the family have to encounter the adversity caused by communicative barriers and other factors, mutual help during this period also directly strengthens the relationship between them.

Besides, the alternation provides an excellent opportunity for children's language development. Especially for Chinese people who regard English as an indispensable skill for the future development, by migrating to an English speaking country, their children have no choice but to practise English in the real situation, during which time they also acquire the cultures behind the language and form different thinking patterns. In other words, not only can these children learn the authentic language, the lateral thinking can also be cultivated throughout this period.

Admittedly, there would be a tendency to be isolated if the adaptability of their family members are not that well. After all, communication misunderstandings and ambiguities resulting from cultural differences do exist, which may demotivate them in the initial stage and they will become reluctant to step outside. However, before going abroad, these family member can take relevant training courses to prepare for their future life, and after going abroad, it is very important for migrants to provide timely support and help to their families.

In conclusion, it seems to me that although the migration has some adverse influences on their lives, there are actually more benefits brought about by this tendency.

报告类 人们搬家的原因和利弊分析

Nowadays, many people change their places to live for several times during their lifetime. What are the reasons? Do the advantages outweigh the disadvantages?

范文:

In the current era, people seem to be accustomed to moving to different places for living while they might stay in a city for their lives in the past. This essay will examine the reasons for it and analyze the possible effects.

To begin with, increasing population mobility may arise from globalization to some degree. It is common that currently, many employees in excellent enterprises will be sent to different countries in order to open new branches. Then, these employees, if they intend to be promoted, have to follow such instructions from their superiors. Thus, it is globalization and expansion of transnational enterprises that make their employees move to new places for living and working more frequently. Another reason is that the ever-changing world, which is full of chances, is so alluring that people, especially young people, are desperate to move to a new place, looking for a chance to start their entrepreneurs. This is very common in some less-developed countries where young people tend to move to some metropolises such as Shanghai, Beijing, to seek for a decent salary, high-quality of life and achieve their ambitions, as a result.

Some people show their concern about this trend, worrying that this could lead to the fierce-competition in the host-countries and the brain-drain of the home countries, and this could also widen the gap between the rich and the impoverished areas. However, this phenomenon does generate advantages. From the economic perspective, most people who move to other places are more likely to send some of their salaries to their home to support their family, helping their family to shake off the poverty. It also provides plenty of labor force and consumers to the host countries. On the cultural level, with the increasing mobility of people from different cultural backgrounds working and living together, the mutual understanding and cultural communication among different races have been greatly promoted, thus blurring the line between the nationalities and races.

In conclusion, the development of technology and the need of personal pursuit render the frequency of changing residences an irreversible trend and I personally believe this will be much more beneficial considering its benefits both to the economy and culture.

利弊类 越来越多人不认识邻居

Nowadays an increasing number of people do not know their neighbors. Do you think this is a positive or negative trend?

范文：

Today, there is an increasing trend that residents in a same community do not know each other. While this phenomenon is usually frowned upon by many socialists, I would say any social phenomenon should be considered from both positive and negative perspectives.

Indeed, some sociological experts tend to focus on the detrimental ramifications of the alienated relationships between neighbors; they may point to their apprehension in terms of public safety and cohesion of society. It is true that lack of the backgrounds of households living next door may give rise to inadequate sense of security in a community. To complicate matters even further, at the sociological level, the weakening safe consciousness in neighborhoods may escalate social identity among the entire populace – younger generations grown up in such a community could be increasingly indifferent to others' plights, and the phenomenon may therefore exacerbate isolation and public apathy prevailed in modern society.

While such a misgiving about alienation between neighbors does have its justification to some extent, I have to say the ramifications of any social episodes are subject to the viewpoints from which people see the phenomenon. Based on this, the discussion can then move on to handle questions as to which social impacts are more desirable in the local context or what local residents value more – the same issue that seems repulsive to some people could be beneficial to others when considered from a different aspect of society. In a society where privacy is given priority, to be less entangled in neighbors' affairs is a social rule embraced by the majority. Not to be left behind is the underlying relevance to independence of individuals – living in solitude may compels people to be more self-reliant rather than depending on help from the strangers next door.

From what has been discussed, it is my conclusion therefore, the weakening sense of community can be recognized both as negative and positive; it is context dependent.

混合类 母亲的角色与父亲角色不同

In some societies, the role of a mother differs in some ways from the role of a father. Why do you think these differences exist? How might parental roles develop in the future?

范文:

The parental role played differently within a family is closely linked to the cultural context in some parts of the world. This essay will discuss the reasons for this type of difference and its future development.

When it comes to the fact in some parts of the world that parenting modes are different between mothers and fathers, we should first take a glance at the social environment in which these families are put. It is traditionally believed in certain countries that the roles of a couple within a family vary largely, between which the male should always act as an opportunist, sparing no efforts in the outside world to struggle to the hardships and fierce surroundings and to bring back their family living resources. Simultaneously, women should be relatively conservative, since they are on the one hand protected and provided with living materials by the men, and maintaining the orders inside the family on the other. That directly gives rise to the scenario that in certain families, what a father does is to provide his kids with sufficient daily demands, but the maternal care to pay attention to every subtlety of the kids ranging from their living habits nurture, their study life to their physical and mental well-being.

Like most things, the future development of the parenting mode in the modern world would be impacted largely by both the traditions and conceptions newly emerging from the industrialized society. One speculation suggests that more women would opt to go out of the “safety net” woven by men and become opportunist, playing the role of a “giver” and leaving their husband to take care of their children, since feminism tells the former that they should have everything the same as men. There exists, conversely, another awareness that in the foreseeable future, ways of working would become different, and both the parents can do their jobs online and at the same time get involved in the childcare together. However, due to the conventional thinking listed above, parents in some parts of the world may still have a long way to go if they want a change in parental roles.

In conclusion, the cultural context in some countries plays a part in the differentiating ways of parenting between mothers and fathers, and the future of the parental role development depends on different factors of the society.

利弊类 父母角色互换的利弊

In many places the roles of mothers and fathers are changing. Do you think it is a positive or negative development?

范文:

The role of two genders are gradually altering in recent years. Personally, I believe this trend may result in more unfavorable influences.

First of all, as men may have certain social expectations which are not easy to be shifted, the alternation of family roles may bring about discrimination to them. In other words, in most societies, the males are supposed to make good fortune and support their families, and if they abandon their jobs and act as the housework chores, the people surrounding may underestimate them or even insult them as 'sugar daddies', by which I mean males may suffer from mounting mental pressure due to the shift.

Apart from the psychological barriers that males may suffer, females also may encounter certain obstacles even when they superficially obtain more freedom to work. Admittedly, the employers are not allowed to discriminate on the basis of gender, but there do exist the glass ceiling that bars females from upper management in large corporations, as once women determine to become the mothers, they cannot avoid having the maternity leave for three months or more to recover from the operation and take care of their infants, which may delay the daily progress of the company's projects. Therefore, after the change of the roles, these mothers are expected to support the families, and they would have no choice but to sacrifice both the time accompanying their new born babies and the physical health of themselves so as to maintain their current positions in their enterprises.

Yet it cannot be denied that the converting roles of the parents does mean the huge progress in gender equality as women are now no longer forced to be the housewives and acquire more freedom to continue the occupations they like. However, from my perspective, this tendency is only beneficial for those families whose mothers obtain much greater capacity for work and fathers are eager to cater for the children by themselves. After all, if these parents are not willing to change but to go after the flow, this tendency may become tortures for both of them.

In conclusion, it seems to me that the trend exerts detrimental influences on most families mainly because of the pressure and burden that two gender may both suffer from simultaneously.

范文 2:

There has been a serious change in roles of fathers and mothers in many places. Many fathers have become the primary caregivers and mothers take responsibility to pay bills. Personally, the transition of parenthood is a positive thing.

First of all, the changes in the roles of members in the family could be seen as progress because women are not put under pressure to sacrifice their own careers to assume childcare and domestic responsibilities. This ensures that we live in an era when different genders have equal opportunities and someone is not deprived of a great career or a big opportunity only because of her gender, which is a great chance that allows the parents to decide who to earn money for the family and who to take care of the family, not based on social and traditional belief.

In addition, man housekeeping can contribute greatly to nurturing of the kids. For example, gardening, fixing household equipment as well as changing a flat tire are the tasks mainly undertaken by men. Therefore, growing up with father can grab the opportunity to learn these useful skills, which will be also beneficial in their future life.

Finally, males give children more freedom in many ways than their counterparts. In many Asian families, for example, women will force their children to attend certain courses and tutorials for improving academic performances, while men are more likely to allow children to pursue their own interests and hobbies such as sports and music. If children are given more freedom to discover their own passion, they will become more confident and live with more optimism.

To conclude, I personally support this newly formed trend of fathers in up bringing their children while staying at home. This is truly helpful in propagation of equality among all members of the society.

公众号：雅思情报圈

报告类 家庭主夫的原因和利弊

In some countries, more and more fathers are staying at home to look after their children, while mothers work full-time. What are the reasons? Is it positive or negative development?

范文:

Different from the tradition that mothers were responsible for the household chores, nowadays more women become the family breadwinners while men work as the housework undertakers. There seems to be several factors contributing to the role shift, and I believe that it is a positive change for the family.

The two main reasons lie in the social and domestic factors. From the social aspect, the transformation of the social ideas and the advanced technology provide increasing number of job opportunities for women. On one hand, the equal access to education for both genders equips the female with coequal competitiveness in the workplace. On the other hand, the automation, which has released most of the workforce in the manual work, enables women to take over half of the job market. Correspondingly, women gain increasing financial independence. Once the males lose competitiveness or fail to regain the employment, their spouses have to shoulder the domestic financial support.

So beneficial does the innovative family pattern bring to the both financial stability of the family and upbringing of the offspring. Undoubtedly, the role shift can release the financial burden in some cases. If the mothers are of stronger working capacity, it makes more financial sense for the mothers to take the full-time work while the fathers serve as househusbands. Besides the family reason, fatherly care and cultivation are more likely to bring a positive outcome on children's maturity. Experts believed that a rational and open-minded father always leave an incomparably profound impact on the formation of children's personalities and cognition to the world. Spending more time with fathers, the kids tend to have an objective judgment on the outer world, for example.

In conclusion, the society has been witnessing the inevitable change on the gender roles as a result of social progress and financial pressure. Such advantageous to stabilize the family and nourish the children.

观点类 住在大城市对人们的健康不好

Living in big city can be bad for people's health. To what extent do you agree or disagree?

范文:

It is true that city offers a safe, affordable metropolitan environment with a cosmopolitan atmosphere supporting a range of cultural events, services, educational institutions, and business opportunities as well as an excellent public transport system. Recently, however in many countries where tabulations have been made, city residents face shorter life expectancies than their rural counterpart. I personally agree that urban life is serious concern for our health, mental wellbeing and outlook.

A grave problem of cities is pollution, as environments deteriorate. It cannot be denied that air, water and land are severely polluted in a city. The main causes for this are lack of proper disposal of wastes, large number of industries lacking purification facilities, lack of proper sanitation, use of coal, petrol and diesel which cause extreme pollution, incomplete combustion of fuels and many more. All of these directly lead to respiratory illnesses like emphysema of city dwellers.

Another fact we cannot afford to neglect is that prevalence of psychiatric disorders is significantly higher among people living in urban areas. Specifically, people in cities suffer from mood disorders and anxiety at a disproportionately high rate as city dwellers often face intensive competition, higher rates of crime, social inequality and isolation as well as other environmental or psychological stressors than those living in rural areas. Also an increasing number of studies have consistently linked the risk of developing schizophrenia to urban lifestyle.

Despite the theories posited above that certain characteristics of city life, per se, are negative influences on physical and psychological well being placing individuals in peril, the simple fact of living in a city should not necessarily entail such risks, because there are ways to curb the effects on city living. Fortunately, society is more aware and empowered to address issues of urban health. For example, business and industry are encouraged to move to regional area and urban policymakers have started to increase the availability of green space needed to relax aiming to improve air quality and shift the mental distress into a lower category.

范文 2:

Millions of people every year from some corners of the world migrate to metropolis in order to share more social resources like better schools for their children and more working opportunities for

themselves. Obviously, what those immigrants ignore is threats for their health that they have to face there.

Primarily, big cities are more likely to suffer from environmental pollution, and hence contaminated living environment in large cities is destroying citizens' health there. Both polluted underground water system and unbearable air quality cannot guarantee the local to have a safe living environment. Instead, in some relatively undeveloped areas people usually do not need to worry whether they should wear masks all the day or whether the water they drink every day is really drinkable or not. Besides, noise from transport in cities is another significant pollutant plaguing people living there especially at night. It is perceived as needles to prick people's ears all the night. Living under circumstance like this, people are extremely far away from owning a healthy life.

Worse still, living in great tense is ruining health of residents in large cities both physically and mentally. Due to the unbelievably high living cost in big cities, those city dwellers must work hard to earn enough money to support their families. Workplace competition and widespread overtime work might bring employees huge pressure, which without a hitch makes them nervous and anxious day and night. Surviving with so much stress, people will consequently suffer from many kinds of disease like insomnia and high blood pressure. A growing number of mid-age people in cities come down with some illness that only old people could get in the past time, meaning that health conditions there are declining year by year.

Briefly, dangers to health of residents in large cities can be attributed to polluted environment and mental stress bothering people in cities almost every day, despite plenty of convenience and comfort that they can enjoy there. Therefore, health conditions of people living in big cities are definitely under threats.

报告类 城市发展中年轻人的焦虑

With major cities continue growing, are there any problems to young people? How to solve these problems?

范文:

Young people in large cities are struggling with many problems arising from city expansion and I believe that we should take some actions to help them tackle these problems.

Youth unemployment is the first challenge many young people have to overcome in urban areas. Cities are home to many companies, including transnational enterprises, which offer well-paid jobs and attract more and more working people from rural areas. This means that the competition in the job market is increasingly competitive and many people are willing to work long hours without asking for extra pay in exchange for job opportunities. The employment prospect is limited for most young people, especially those who do not have adequate hands-on experience.

The rising cost of living is another problem facing young people living in big cities. The economic boom of these cities has attracted many migrant workers who flock to these cities for job opportunities. The explosive population growth means that the demand for necessities such as medical care, housing and food surges. This is why many young people cannot cover living expenses and afford their first home. They are not able to improve living standards or start a family without working hard.

There are two potential solutions to this problem. Firstly, governments can offer economic incentives to encourage young people to run their own businesses. For example, a tax break can be provided to reduce the start-up cost, and some young adults may choose to run an online shop. This can alleviate the pressure on the labour market. Another method is to allocate more resources to the development of small towns and rural areas. Business organisations may receive financial support from the government to open new branches in these areas, creating jobs to attract young people from cities. This can slow down the population growth of cities.

In conclusion, unemployment and inflation are two problems facing the young generation in cities. Government action is an essential part of the effort to deal with these problems.

范文 2:

It is apparent that urbanization occurs rapidly for a number of reasons in many parts of the world. Accordingly, these regions are also experiencing a vast and growing population of young people, who

unfortunately, are running into major challenges at the threshold of urbanization. As this stands, strategies should recognize and proactively address these challenges head-on.

It is observed that youth experience the challenges of employment and economic inclusion differently or more acutely than other populations. As cities are expanding, the number of urban dwellers are growing year on year as people migrate to cities to study, work and live. The lack of developed land for housing, large influx of rural immigrants to the cities in search of better life, and the elevated prices of land and building materials all exacerbate the scarcity of houses. Therefore, although income in urban areas is high, the soaring costs of living make the incomes seem horribly low, especially for young dwellers, who primarily with comparatively lower income, do not own decent amount of savings at their disposal. Also, it is noticed that the problem of joblessness is pervasive in urban areas, and it is even higher among young generation. As the illusion that there are ample job opportunities that provide access to high salary, continually draw people from rural areas to seek better livelihood, the intensifying competition and the increasing relocation of people from rural or developing areas to urban areas is the main cause of unemployment.

Fortunately, there are some feasible practices, which could help mitigate the negative impacts of urbanization. Firstly, the government could speed up the introduction of efficient markets for labor and capital. Private investment should be encouraged so as to utilize resources and create more job opportunities, while subsidies and grants may as well be provided to guide and ensure sustainable development projects. Secondly, urban planners could dedicate to ensure essential social services including education, health and housing to be available and affordable to all urban dwellers. Plans to further loosen the regulation of urban household registration could be put on agenda, aiming at allowing migrant workers to settle down and have equal access to public service as their urban counterparts.

In conclusion, we should not be simply keen on developing a city without considering those negative consequences. Instead, the urban shareholders should modify the urban development process and outline promising initiatives to design and build sustainable cities that embrace safe and livable habitats for the youth populations.

双边类 生活在大城市累还是轻松？

Some people think living in big cities is difficult. Some people think it is easy. Discuss both views and give your opinion.

范文：

The question how hard life is in metropolises has divided the general public for decades. However, before scrutinizing its pros and cons, I tend to question the argument in terms of the criterion of the so-called 'difficult or easy' – which is just a subjective term that differs with individuals – both views could have their justification depending on how people define the precise definition of the difficulty in living in big cities.

From the perspective of public amenities, well-developed cities do have overwhelmingly benefits over their small-sized counterparts, whether these be public transport, water and electricity supply systems or communication infrastructure, which is particularly appreciated by businessmen and working adults who rely much on these services for their business operations. Also, for the time outside working hours, metropolitan cities, with their numerous department stores, restaurants and art galleries, are also recognized as a paradise where their residents can have many choices to spend their leisure time.

However, at the other end of the scale stand many people from less well-off families who are concerned more with the high stress to reside in big urban areas: the convenient and colorful metropolitan lifestyle that works for those with better social status does not translate as well to the needy living in poverty who are suffering financial burden as rental, food or medical services, not to mention many unemployed who cannot afford such basic needs. Adding to the economic concern is the mental pressure of working in populated cities, one frequently mentioned problem being the long toiling hours – the long-term exposure in such a condition inevitably exacerbates mental health problems like anxiety or depression.

From what has been discussed, it looks to me that life in big urbans could be deemed both difficult and easy in terms of the discrete social status and needs of individuals.

报告类 城市化致使年轻人会面临的问题

The major cities in the world are growing fast, as well as their problems. What are the problems that young people living in cities are facing? Give solutions to these problems.

范文:

Young people in large cities are struggling with many problems arising from city expansion and I believe that we should take some actions to help them tackle these problems.

Youth unemployment is the first challenge many young people have to overcome in urban areas. Cities are home to many companies, including transnational enterprises, which offer well-paid jobs and attract more and more working people from rural areas. This means that the competition in the job market is increasingly competitive and many people are willing to work long hours without asking for extra pay in exchange for job opportunities. The employment prospect is limited for most young people, especially those who do not have adequate hands-on experience.

The rising cost of living is another problem facing young people living in big cities. The economic boom of these cities has attracted many migrant workers who flock to these cities for job opportunities. The explosive population growth means that the demand for necessities such as medical care, housing and food surges. This can slow down the population growth of cities.

In conclusion, unemployment and inflation are two problems facing the young generation in cities. Government action is an essential part of the effort to deal with these problems.

混合类 大城市生活质量越变越糟的原因

Today, the quality of life of people in big cities is getting worse. What are the causes of this problem? Any measures should be taken to solve it?

范文:

The characteristics of city life is often posited, closely related to ambient psychosocial stressors and physical environment hazards. As cities have clearly played a major role in the creation of the decreasing level of life quality of the city dwellers, they will form a central part of any response.

Big cities are associated with a high cost of living. Houses and apartments in prime neighborhoods tend to be much smaller and much more expensive. Goods and services can also be more costly, in comparison with their rural counterpart. The cost of living is barely mediated by average salaries and public transportation, which will constantly put those dwellers under enormous pressure and anxiety at a disproportionately high rate. Another grave problem of cities is the deterioration of the living environment. It cannot be denied that air, water and land are severely polluted in a city. The main causes for this are lack of proper disposal of wastes, large number of industries lacking purification facilities, lack of proper sanitation, use of coal, petrol and diesel which cause extreme pollution, incomplete combustion of fuels and many more. And rising urban populations mean these problems may soon get a great deal worse.

Yet evidences suggest that measures can be taken to make cities work better in terms of emissions and sustainability and make them work better as prosperous and attractive places to live and work as well. For instance, an increase in blue space visibility and availability of green space to relax could help ease mental stress, shifting people from moderate distress into a lower category. All cities can guide urban planning and prevent the expansion and lock in of high-carbon infrastructure or offer complementary measures on public transport, cycling, electric and shared vehicle infrastructure. A transformation in the energy supply mix, together with a step-change in energy efficiency of technologies and change in energy consumption is also worth considering.

In conclusion, it is undeniable that city life, per se, is placing the environment and individuals in peril. Fortunately, society is more aware and empowered to address these issues of urban health.

报告类 政府鼓励人们搬去郊区

People who live in big cities are faced with more and more problems. What are the problems? Should the government encourage people move to suburb?

范文:

Highly influenced by the notion that cities have achieved economic, political and social mileages compared to rural areas, a high population resides in big cities, making urbanization occur rapidly. As the promise of jobs and prosperity, among other factors, continues pulling people to cities, extensive urbanization is causing adverse effects.

It is observed that as urbanization attracts people to cities, it declines the quality of living for urban inhabitants. The increase in the number of people living in big cities will definitely elevate prices of land and building materials, contributing to exacerbation of the scarcity of houses. Also, it is noticed that the problem of joblessness is pervasive in urban areas. As the illusion that there are ample job opportunities that provide access to high salary, continually draw people from rural areas to seek better livelihood, the intensifying competition and the increasing relocation of people from rural or developing areas to urban areas is the main cause of unemployment. Besides, as much as income in urban areas is high, the soaring costs of living make the incomes seem horribly low. Worse still, in extreme cases, there may be widespread poverty and socio-economic disparities.

As is obvious that we must realize that our city resources either in terms of land, infrastructure or other nature resources are not limitless. When faced with an increasing population density, cities are not sufficient to cope with the influx of new inhabitants. Under such circumstance, government policies favor the migration from city to suburb is fairly justified. By moving to suburb, people escape from the problems of the city such as high living cost, pollution and overcrowding. Land is cheap and affordable. Unlike city where usually crowded with people, buildings and traffic, suburb offer vast space, fresh air and natural scenery.

In conclusion, city life is by no means bad per se, but people living in big cities unavoidably are threatened by some of the consequences causing by rapid urbanization. Encouraging people to move to suburb, at current stage is more plausible, though it may not necessarily be the only solution.

观点类 社区关系变得冷漠的原因及解决方法

City dwellers seldom socialize with their neighbors today and the sense of community has been lost. Why has this happened and how to solve this problem?

范文:

Most city residents nowadays have lost their sense of community due to the lack of daily interactions with their neighborhoods. There are multiple reasons behind the issue and measures have to be done to reverse this trend.

First of all, the excessive pressure people facing nowadays inevitably discourage them from socializing with others. Compared to decades ago, residents enjoy much less leisure time. For most people, especially city dwellers, there are always numerous works and tasks waiting for them to be completed. In order to be distinguished in the ever increasing population, they have no choice but to work harder. The fierce competitions in the workplaces continuously compel working people to devote more time and effort into the work.

In addition, Internet and mobile phones have significantly changed the way people communicate. Before the Internet, people actively participated in community activities to have fun or build their social networks. Today, however, individuals can easily contact with others miles away through modern technology. When they get off work, they tend to indulge in social networking sites like Facebook and Instagram to relax. Therefore, it is nearly impossible to bond community ties.

However, this is an unhealthy development and may lead to various social and psychological problems. In order to tackle this, everyone should understand that their neighbors would be more helpful than their closest relatives in case of an emergency situation at their homes. People must reduce the usage of social media which are full of virtual friends and should rather focus on building harmonious relation with their neighbors.

To conclude, the increasing competitions and excessive use of the Internet and phones are the main culprit of declining sense of community. However, if people could make some adjustments in their life, the situation would be changed without any doubt.

报告类 年轻人不快乐

In some countries, young people are not only richer but also safer and healthier than ever before. However, they are less happy. What do you think the causes of this and what solutions can you suggest?

范文:

The youngsters in contemporary society seem to be unhappier, though they are much more affluent, secure and robust than their counterparts in the past. In the following essay, I aim to explore the potential sources of this phenomenon and suggest some viable solutions to it.

The possible causes of moroseness in the young can be manifold. The first culprit might be their enclosed mode of life. In the light of the ever-accelerated advancement of indoor entertainment devices, an increasing number of young individuals choose to enjoy their spare time within their home and indulge themselves in various social websites. Unfortunately, these isolated and virtual experiences fail to guarantee them effective interpersonal communication skills in real life, contributing to difficulties in their social life with other people. What's worse, some of them even become alienated with their family members as a result of their addiction to the smartphone.

Besides, the enormous pressure from study or work might be another force for their unhappiness. Despite considerable improvement in the living conditions for the young, the expectance for their impressive academic or work performance is increasingly high. Under this suffocating stress, numerous students have no alternative but to resort to endless exercises, while a great many young employees who are encountered with fierce competition frequently work overtime. In this way, it is unlikely for them to maintain a good state of mind to find the joyful thing in their seemingly dull routine life.

A series of effective measures should be taken to cope with the situation. First, it is the responsibility of parents to create a happier and healthier upbringing set for young people by restricting their use of electronic devices and guiding them to enjoy more interactive lifestyle in real life so as to help them have a more delightful family life. And efforts should also be made by the young themselves to enlarge their circle of friends by organizing or participating in the outdoor group activities more actively. Second, teachers and employers are obligated to attach more emphases on the healthy psychological state of the young and endeavor to alleviate their mounting stress, which is definitely helpful to create a therapeutic atmosphere for the young.

观点类 创建一个更幸福的社会

Some people believe that the best way to produce a happier society is to ensure that there are only small differences between the richest and the poorest members. To what extent do you agree or disagree?

范文:

It is true that people are becoming keen to promote a happier society nowadays. I disagree with the idea that reducing the gap between the rich and poor is the best way to do so, because I believe other ways are equally effective.

On the one hand, I agree that narrowing the rich-poor gap is beneficial to a happier society. To begin with, reducing the disparity among different social classes can help to mitigate discrimination in society. When the level of wealth for everyone has minor differences, people in all lines of work will experience a more acceptable and welcomed society. Next, this is also a good way to make fewer disputes and crimes to our society as the differentiation between the wealthy and impoverished is responsible for many crimes.

On the other hand, I believe other approaches can also produce a more enjoyable life for us. Firstly, it is vitally important to ensure law of justice for every member of society, meaning that people would be fairly treated, and everyone will have the sense of safety. Secondly, people's level of happiness will certainly be increased if corruption is eliminated. Public service workers do their jobs that satisfy public's interests as we are taxpayers. Finally, government can also allocate more nation budgets to public education system, aiming to provide free education. Granting everyone a chance to approach knowledge can reduce unemployment, promoting a more productive and prosperous nation.

In conclusion, while reducing the gap between the rich and poor can promote a happier life for everyone, I do believe it outweighs all other approaches.

观点类 老一辈传统观念对年轻人的影响

The older generation has very traditional ideas about the correct ways of life, thinking and behavior. However, some people think that these ideas are not helpful for the young generation to prepare for modern life. To what extent do you agree or disagree?

范文:

To assess whether the traditional ideas of how to live correctly is pointless to the modern way of life among the young generation, one may have to first define what the “traditional idea” is.

For those who have seen the huge distance between the established living conceptions and the modern way of life, they may hold that, as it were, the stubborn, conservative lifestyle can hardly catch up with the ever-changing paces every day. Let us just take a glance at what the younger generation is having in today's daily life: information is shared over the internet and integrated by multiple apps on electronic devices, easy for everyone to communicate and socialize with others without any distance barrier; almost all face to face social engagements are less necessary, and nearly every basic need--services, consumer goods, etc.--can be gained and purchased by virtual commerce. All these scenarios were totally unimaginable a decade ago; should the old-fashioned, outdated ideas be based on what we experienced in the old days, it would be obvious how meaningless they are supposed to be in this era.

The thinking listed in the paragraph above, as others would argue, would be relatively reckless and sometimes, the rankest of all; it precludes youngsters from deeply thinking what causes life to be as convenient as it is today, and deprives them of the chance to recognize the potential that lies. The certain knowledge that sources from the past may seem invalid to our modern life, but it doesn't mean that the ideologies and thinking systems are helpless to the construction of the life of the young generation. A case in point is the philosophical system dated from the ancient Greek, which seems far from where we are living, but comprises the fabrics of almost all disciplines that are proved extremely helpful to our modern life. Who is to say that what we possess currently, every fantastic subtlety that surprises us today, does not come from the classic theories and great ideas that are come up with by the generation in the old days? And our human, as the inquisitive and rational beings, did not build up our current understanding of the world on the established knowledge structures?

In conclusion, I would certainly believe that the established living conceptions do play an important part in the life lived by the young generation since I share the wisdom of looking at all things as a whole and appreciate the classic ideologies in terms of their long-lasting values to the life nowadays, and to the future.

双边类 政府养老还是自己养老

It is the government's responsibility to provide financial support to old people after they retire or individuals should save money for themselves. Discuss both views and give your own opinion.

范文:

In spite of the fact that many countries are facing the dilemma of aging population, the support of retired people becomes one of the most heatedly discussed issues. There are some people who argue that the subsidy of older people should be granted by the government, while others believe that individuals do have the responsibility to raise themselves.

It cannot be denied that supporting older people is one of the fundamental duties for the state to undertake. This is so because that most of older people have been the tax-payers as well as the health insurance for decades before their retirement. Therefore, it is right of them to enjoy the retirement pension provided by the government since the state has utilized the funds to support the last generation.

Nevertheless, individuals also have the obligation to raise themselves. For most of the general people, the retirement pension might be only half or one third compared with their original income before retiring. However, during this serious aging society, it is nearly impossible for the government to promote the payment of pension. Saving certain amount of deposit means older people, on the one hand, have the condition to enhance the well-being and relieve the financial pressure of their children, and on the other hand also relieve the pressure of the government so as to make it possible for the government to allocate money to more pressing issues such as medical insurance and infrastructures.

It seems to me that both governments and individuals have the responsibilities to subsidize the older people. It has become the prevalent phenomenon in China for older people to enjoy both the pension supported by the state as well as the deposit saved by individuals themselves.

观点类 年轻人照顾老年人是否要立法

If old people cannot physically, mentally or financially support themselves, younger family members should legally support them. To what extent do you agree or disagree?

范文:

People's life expectancy has improved in many societies and the population of the ageing generation are also soaring. Many people believe that the government should set laws and regulations to ensure that the old are well taken care of physically and mentally. Personally, I believe that it puts young people under huge pressure.

It is true that setting legal requirements to take care of the old people would be beneficial. In this way, the young have the obligations to support their senior family members from various perspectives so they would not suffer from loneliness and isolation. Therefore, a society with better life quality for the senior citizens can be anticipated. Apart from this, many cultures traditionally believe that it is the young generation's responsibility to look after their parents when they lose the self-care capabilities, while introducing relative laws would stimulate the people with less fidelity to follow the social norms.

However, putting the pressure for the young generation alone is unrealistic and unreasonable. Firstly, the young have to face intense competition to support the family financially. As a result, they have less time to care for the old especially when the elderly suffering from serious diseases which requires all-day care. Hence, the breadwinners of the family may lose the balance between work and their care-taking obligations. Going even further, the workforce in many countries may shrink owing to the weakening productivity and efficiency. Secondly, the elderly may have more choices apart from staying together with their offspring. For example, the nursing home with comprehensive medical equipment and well-trained nurses provides better living conditions.

To sum up, although enacting laws to enforce the young to look after the elder generation is beneficial to the old per se and the society, young people would have to bear a heavier burden.

双边类 变老的影响

Some people think getting old is bad for them in the modern world, while others think older people today live better lives than in the past. Discuss both views and give your own opinion.

范文:

The aging population nowadays is taking an increasingly large proportion in our society. Some people claim that it is tough for the elderly people to live a decent life in the modern society. Personally, I tend to have a different opinion.

It is true that the senior citizens may face some difficulties in their lives. Firstly, people's physical condition deteriorate inevitably as time passes by. Hence, they may suffer from various diseases and may lose the ability to support themselves financially and physically. Besides, the advancing technology may cause some difficulties for them since it is hard for them to acquaint themselves with the latest technology. For example, the online payment is pervasive nowadays in our country, but a majority of elderly still use the cash because they are not able to use them very well, which brings troubles in their daily lives.

However, we may also notice that the aging population may also enjoy better living condition than their counterparts in the past. To begin with, the medical advances greatly prolong people's life span. Some common diseases like diabetes and hypertension now are no longer serious problems since their symptoms are sharply alleviated by intaking latest medicines. Apart from this, if the elderly are not willing to live together with their offspring, nursing homes today also provide much more well-rounded care systems with qualified medical personnel, which brings massive conveniences to their later lives.

As far as I am concerned, the senior citizens today are living a far more comfortable life than few decades ago. And I believe they should hold a positive attitude towards their lives and embrace the changes in this modern world.

报告类 生育时间变晚

In some countries around the world men and women are having children at a later age than in the past. What are the reasons for this development? Do advantages of this development outweigh disadvantages?

范文:

In the past, people used to have children early, usually after turning 20. However, in the modern society, some individuals reduce the priority of having babies. It seems to me that mounting financial burden of raising babies, fierce competition faced by the young couples and being short-handed when facing the dilemma of taking care of infants are the three reasons for this change. Personally, I believe this alternation is beneficial to both individuals and the society.

The first advantage of this development is that by having babies later, people are able to make a better understanding of family and meanwhile better financial foundations. Engrossing in their career, those individuals have been provided sufficient experience of the surroundings and a greater likelihood of affording the basis of living such as accommodation, vehicle and etc., which means that their next generations will be more likely to enjoy refined education and high living standard.

The delayed parenthood also brings merits to the society. It is because that those parents who delay having kids and advance to positions of authority at work now have the power to set policies that other older parents would benefit from, like offering paid maternity and paternity leave or allowing flexible work schedules.

Admittedly, hypothetically speaking, if people found their marriage partners in their school age or more luckily in their childhood, it would be really nice to have a family and then give birth to infants early, which is positive for both female's recovery and babies' genetic growth. However, as for those who engage in their work or study and cannot distribute their time to other stuffs, this cannot be regarded as a responsibility and having children too early can only degrade their living situation.

In conclusion, although having babies early can bring about some benefits, this should not be regarded as a compulsory part of life.

混合类 15 岁以下人口越来越多

Figures show that some countries have an ever-increasing proportion of population who are aged 15 or even younger. What do you think the current and future effects it may have in those countries?

范文:

Some demographic surveys have shown that the proportions of young people are rising rapidly. This may be because of any reasons such as illiteracy and poverty or wars or any other reasons. This essay shall delve into the immediate and long-term outcomes of this trend on those countries.

The most important current impact of such a trend would be on the national economy. To be specific, the government has to invest a lot on educational institutes, as more children need more schools and colleges, which will definitely exert an adverse effect on other important fields such as infrastructure and medical care. In addition to the effects on economy, there would be social implications also. The young population has lot of energy, which must be channelized in the right direction, or it would lead to crime and violence in society.

Considering the future effects of this trend, I believe that it would mostly depend on the economic factors and job facilities of a country. If the country has a great economic stability and can create plenty of job opportunities in the future, the under-aged population now would become the de facto to the economy in the future and that would enable the country to develop rapidly. The country will have a huge workers and professionals in the future and they would be able to increase the GDP of such a country. By contrast, if the country fails to ensure jobs and business opportunity when those children will become adults, the outcome would be catastrophic. The unemployment and crime rate would surely increase and that would negatively affect the social stability.

To sum up, the long-term effects of having more young people depends on how the situation is handled today. If handled well, the culture and lifestyle of these countries would be transformed. Fresh opportunities and challenges would both be on the way. The trend would cause multiple possible effects and these countries should strengthen the education and health infrastructure to overcome its negative influence.

利弊类 预计很多国家未来成为老龄社会的好坏

It is expected that there will be a higher proportion of older people than young people in many countries in the future. Do you think it is a positive or negative development?

范文:

I would certainly believe that the ageing trend would be negatively linked with the development of the overwhelming countries in both financial and resource respects.

Financial problems may be the top concern of the entire society facing the proliferation of the greying populations. Directly, there is no doubt that government would experience a hard period with economic burdens when allocating more monetary flows on the pensions of the old generation. Wealth of a particular social system mainly comes from the contributions of adults, and it is also the source of almost every actions of the macro manipulations-medical cares, subsidies, poverty alleviations, investments on transports and other infrastructures-by means of the governmental taxes or social security schemes. Once the population of the senior sectors increases accompanied by lower fertilities, as well as a smaller share of younger age groups, financial outputs may be largely poured into the ageing-related social security system, which would directly reflect in the higher burden of those young generations, since they have to work harder on making this economic balance. Furthermore, ageing problems also give rise to a less powerful production to the whole society notwithstanding the policy of delaying the retirement in some nations, since the seniors may overwhelmingly be lack of the same degree of energy and learning abilities as the prime of life to catch up with the speedy paces of the social advancement. This would somewhat lead to a shrunked economy of a certain society.

Resources are also a serious problem being impacted by the elderly growth. On the one hand, they may dominate certain infrastructures or basic assets which are supposed to be balanced to all age groups. Medical cares would definitely lean to those physical weaklings resulted from their ageing, since they are more likely to be stuck in age-related diseases. Therefore, a scenario of a long waiting line queuing in the lobby of the hospital, in which the majority is the seniors, will be hardly strange in any city. This would provoke a lopsided life in the curative area, because more physicians are needed for the clinical majors regarding to the ageing issues, or even may become the obstacle of other medical disciplines. Whilst the surroundings may be forced into a different adoption, being constrained by the elderly. It is hardly far-fetched that when facilities, equipments or devices of the entire society are oriented to a "senior-friendly" direction, along which modern technologies are highly precluded, fashion looks are not favored, and exciting elements are totally prohibited since they may not be adaptable or or tolerable by the ageings, the condition of the society would develop a strange pattern.

In conclusion, adverse effects emerge particularly on economy and social advance if larger proportion of elderly is overwhelming the younger populations.

报告类 浪费商店或饭店买来食物的原因和解决方法

In some countries, people waste a lot of food that they buy in shops and restaurants. Why do people waste food? What can we do to reduce the waste?

范文:

It has long been a matter of conjecture what makes people throw away a large quantity of food while some are still in good condition. To me, it is both advertising from food shops and people's extravagant habit that have contributed to this phenomenon. And I do have several concrete suggestions that could be implemented to curb this problem.

The first culprit leading to the waste behavior is the influence of advertisements from grocery stores, which entice the general public to buy more than they need. And in other way around, when these consumers go home, what they have to do is to discard the provisions in refrigerators to make way for the new arrivals, though many of those abandoned are still within expiration date. One convincing example in this case is the promotion before every Christmas, which means a new wave of old stocks in kitchen to be cleared out.

Apart from advertising, another factor contributing to the problem is the extravagant lifestyle of younger generations. For example, when visiting a restaurant, many opt to order more than they can eat. As a result, some food, though sometimes untouched, are wiped to rubbish bins.

To tackle this problem, multiple measures need to be initiated by both the government and businesses. Firstly, the authority could launch awareness campaigns to publicize the importance of thrift, which aims at those impulsive housewives who are usually infatuated with the flyers from grocery stores. Meanwhile, some incentives in restaurants may play their part, meaning that those places could offer coupons or discounts to encourage customers to pack the leftovers.

To sum up, the waste of food is a complicated issue with both personal and business reasons, which need to be dealt with by multifaceted solutions, from increasing the public consciousness to regulating food businesses. Only by doing so, can this problem be properly addressed.

利弊类 人们喜欢吃外来食物，是否优大于劣

In many countries, people like to eat a wider variety of food than can be grown in their local area. As a result, much of the food people eat today has to come from other regions. Do you think the advantages of this development outweigh the disadvantages?

范文：

Prevailing is the trend that people draw their attention more to exotic food than they do to their local cuisines thanks to the development of the gourmet industry. While it somewhat provides solvable and short-termed negative outcomes, I would argue that the benefits may be overwhelming.

Indeed, plagues of the introduction of food from the outside should be seen initially. Directly, it would bring about health problem. Most of the exotic food depends largely on importation, provoking the uncertainty in terms of the quality and freshness, if any disorder happens among the resource providers, the logistic or the expiration. Whereas the problems would be rarely seen when improvement is visibly implemented in the capacity of preservation technologies, among which the vacuum packaging is sweeping over the market, and the refrigeration schemes can almost fulfill the need for coldest fresh food. So does the faster transportation, which is linking the spaces over a country within one-day period. In addition, the clash between the new comers of the food and the local catering industry also emerges. In a short term, the local cuisine, such as the restaurants, the food retailers or even the individuals related would be badly impacted since consumers are indulged in the gourmet diet derived from another region. Nevertheless, the transient fluctuation inside the industry would be stabilized smoothly and immediately, since this doesn't mean the edges of local food would be lost forever, and diversification in any field has always undergone this one-way street to the final prosperity.

Benefits, both intuitively and potentially, however, would be manifest simultaneously along with the aforementioned limitations. Obviously, it is hardly far-fetched to imagine that the dramatic increment of various flavors in the catering market gives rise to better choices to people, who would have already been weary about their existed indigenous tastes for a long time. Those newly-emerging food experiences would undoubtedly bring about the immediate happiness to people, fulfilling their daily need in a more diverse way. Far beyond this, the food industry within a particular location would prosper incredibly in a short run by horizontally integrating other areas, namely food transportation, logistic, media propaganda, or more freshly, sharing economy over the internet trading. Deeply, cultural learning and communication, on the other hand, would largely be realized if people inject their attentions to things related to their eating—eating manners, geographic and nature of the food provenance, and how to combinate the exotic materials with local cuisine customs. This is extremely helpful to the future booming of different places, since culture-oriented businesses, including commodity exchange and tourism, are more likely to happen.

In conclusion, though the stronger tendency to food outside a local place would provoke limitations in terms of the food quality and a short disturbance to the local food market, solutions can be suggested and more outweighing contributions can be witnessed during the process.

公众号：雅思情报圈

利弊类 人们应当从当地菜农获取食物？

Today food travels many miles from farms to reach consumers. Some people believe that people should eat food from local farmers. It is good for environment and economy. Do the advantages outweigh the disadvantages?

范文：

The benefits generated by the farming produce localization in terms of environment and economy are impractical; defects are outweighing due to this industrial modification from trans-position food economic pattern.

Many consider the local food commercial mode would bring about immediate benefits because they superficially think about the environmental contribution and the lessened costs via limiting food transportation. It is true that by stopping a part of long-distance food importation, air quality would be somewhat improved since less exhaust would be released. So do the carbon emissions. Simultaneously, the saved transporting costs are directly reflected in the pricing procedure of the food commerce, meaning that a more flexible, lucrative trade may be established between farmers and consumers—a lowered cost makes a tiny save of the consumers' purchase. This stimulates the sales of food, then the increased revenue among every sector: farmers, wholesalers and retailers, and the mutual profits are easily realized within the localized primary industry between buyers and sellers.

Whereas the myopic thinking exhibited in the paragraph doesn't allow people to see the truth behind the local food trading without interactions of this industry between areas. The essence of the reason why food needs to travel miles away is that there are imbalances between the need of consumers and what a localized farming industry can provide. Tragedy, however, happens once a place has to expand farming land to fully address the problem of the deficiency in food for the residents: the ecosystem would largely be blighted due to land transformation; the save of emissions is useless because of the gas discharges for burning trees for farming. What is worse, deeply, is the huge fluctuation of food economy when no multiple trades are encouraged: price can be severely raised when in short supply, and the extremely cheap produce impose great pressure on food-related practitioners.

In conclusion, I would very much agree that inefficiencies prevail the advantages if the food trading mode is changed from the multi-area pattern into localized one, since the virtually impractical merits may not be realized, but calamities are easily foreseen.

观点类 自给自足生产所有粮食

Many people believe that countries should produce food for all population and import as little as possible. To what extent do you agree or disagree?

范文:

In the modern society, there are some people who argue that countries should produce large quantities of food which could satisfy all population's needs and import food as little as possible. Personally, I totally disagree with the opinion of the topic as imported food is still indispensable for most of countries worldwide.

The first reason why importing is crucial lies in the fact the imported agricultural products substantially enrich the diet of local citizens and improve the nutrition structure. A convincing example is that people in Frigid Zone would by no means have access to tropical food without the export of farm produce. Because of the existence of express transport such as air freight, those people are in a position to acquire a more abundant supply of food and vegetable.

Moreover, this irrational strategy will also seriously undermine the trade balance of import and export, or even adversely affect the relations between countries. This is so because the produces supply relationship of every country in the world is a circulation. Although such move may eliminate the fear of local residents, this will create panic in many countries which rely on exports as the main source of their economy. Worse still, there is a great possibility that these major agricultural countries will retaliate by refusing to import any goods from those nations that have the policy of isolation. Therefore, this proposal is not only irrational, but also irresponsible.

Admittedly, it is undeniable that there are certain risks in imported food, especially during the global spread of coronavirus in recent two years. At present, the re- outbreak of the epidemic in many places in China is due to the fact that the patients eat imported food, especially frozen food, which unfortunately contained the bacteria, and even in the last two months, coronavirus was detected in imported fruits, causing great panic among the masses. However, as long as the customs strengthen the monitoring and control, these risks can be greatly reduced, and due to this the governments have restricted categories of importing and issued relevant policies and new importing standards.

In conclusion, the opinion of the topic is not feasible and the self-sufficiency within a country cannot be achieved mainly because of the limitation of geographical conditions as well as the damage of trade balance.

观点类 化肥和机器的进步造成负面影响

Food produced in greater amount and much cheaply due to the developed fertilizers and better machinery yet some others say it is dangerous to human health and local communities. To what extent do you agree or disagree?

范文:

As the world's population continues rising, machines and fertilizers are used to maximize the amount of food produced and stabilize the price of food within an affordable range. However, while we are trying hard to produce enough to feed the global population, we still fail to limit the adverse effects of agricultural activities on human health and local area.

The use of fertilizers and other farm chemicals like herbicides and pesticides, is unsustainable and physically and environmentally damaging. Those farm chemicals can be toxic especially when organisms are exposed to high concentrations. Even if fertilizers are scientifically applied to crops in a way which will prevent them from accumulating on the food in harmful concentrations, they are difficult for our bodies to process and consuming large amounts of food treated in this manner, which would probably result in health impacts. Worse still, the application of these chemicals will spoil the land, waterways and air. Once released into the atmosphere, they are absorbed into the soil, mixed into air or digested by tissues of simple organisms, all of which enable them to grow to toxic concentration and remain threat for the whole ecosystem.

For another, the modernization and mechanization of agriculture also imposes detrimental impact on the environment. During the past few years, the weight and size of the machinery have increased significantly, which in some cases exceed the soil's tolerance for load. The operation of machines to irrigate the land will damage the soil structure, make it more vulnerable to erosion and cause greater loss of nutrients and poorer crop yields. Such damages caused by heavy agricultural machinery are usually more permanent and hard to recover.

In conclusion, although various scientific and technological methods are identified to enable farmers to grow crops more efficiently while maintaining yields, a sustainable and healthy agriculture system has yet been achieved.

双边类 经济发展解决贫困和饥饿还是导致环境问题

Some people say that economic growth is the only way to end world poverty and hunger. Others say that economic growth is causing damage to the environment, and should be stopped now. Discuss both views and give your opinion.

范文:

Some people assert that countries should focus exclusively on developing economy so as to eliminate poverty, whereas other believe that the development leads to environmental problems and therefore should be suspended. It looks to me that it is only a question of different emphasis: both views have their justifications depending on the need of different countries.

On the one hand, it does make sense that impoverished countries should prioritize the boom in the economy over its implications on the ecosystem. From the perspective of the advocates of this, the very problem that exhaust these nations is not the habitat of flora and fauna but the backward economy, whether these be low productivity in farming, insufficient investment in infrastructures, or the millions of deaths due to hunger and diseases. Considering this, stimulating economic growth is crowned to be of paramount importance in providing the funds to tackle these problems. One convincing example is China, where the roaring economic rise during the past half century has witnessed a dramatic decrease in its poor population and the elimination of famines.

While the argument has its role to play in less developed regions, it is not justified enough to silence those environmentalists protesting in the streets in industrialized countries, who have already experienced the detrimental ramifications coupled with the economic rewards. In America, for example, it is the popularity of private cars that has become the major culprit for the increase of carbon dioxide. Also, the cost to address the pernicious impacts of some industrial projects might overwhelmingly outweigh their contribution to the tax system, considering the long-term soil erosion and contamination of river due to the hazardous pollution – this concern from an economic perspective also begets the claim that the flourishing should not be at the sacrifice of environment.

In conclusion, each statement has its justification from certain perspective, I would say that emerging economies could draw lessons from the industrialized countries in their experiences in dealing with the relationship between development and ecological system, and therefore initiate a more comprehensive strategy that meet their demand.

利弊类 家用电器变多的利弊

In many countries, more and more people buy a wider range of household goods like television, microwave oven and rice cooker. Do you think this is a positive or negative development?

范文:

It is true that the modern world is moving in a direction where home appliances are playing a more important role in people's daily life. While this trend is applauded by many people, I would say that we should not be too optimistic when considering its detrimental effects on individuals and society.

Superficially, the trend of electrified life does seem to benefit both individuals and economy. At an individual level, the trend liberates many housewives from routine housework, allowing them to do something more meaningful: mothers can spend more time and effort to focus on their beloved babies while leaving the cooking to multifunctional cookers and microwave ovens. Also, in the eyes of entrepreneurs, what concerns them most is the increased revenue thanks to people's increasing dependence on electronic appliances; a further reward worthwhile to mention is the job opportunities created in sectors like manufacturing, retail and even after-sale service.

However, these benefits mentioned above should be considered from an opposite angle. Back to the individual aspect, rather than liberating people from mundane work, their over reliance on the smart gadgets has also resulted in the decline of basic problem-solving ability when coping with housework in reality – were it not for the smart appliances, some youngsters even fail to prepare a simple breakfast. Another problem we cannot afford to ignore is the environmental problem ensued: while businesses enjoy the dividend of growth in sales, what will ensue is tonnes of abandoned and defective electric gadgets. Given that the material of these electrical waste is non-biodegradable, they will stay in landfills for centuries; if the trend continues, there will be one day when our planet will be buried by the electric waste produced by ourselves.

In conclusion, I would say that our convenience brought by electric appliances should not be at the sacrifice of the self-reliance and environment.

观点类 年轻人将大部分时间花在购物上

Many young people today spend much of their free time in shopping malls. Some people think it has many negative effects on both young people and the society they live in. To what extent do you agree or disagree?

范文:

With the rapid global economic increase, more and more shopping malls have emerged in both metropolis and other cities of smaller size. At the same time, young people appear to be one of the most contributing purchasing-power. In this essay, I tend to propose my personal point that such phenomenon is detrimental to both individuals and society at large. The supporting arguments are as follows:

Firstly, for people themselves, shopping malls tend to provide a dominating but relatively superficial relaxation way, overriding other more meaningful, fulfilling or close-to-nature off-work choices. Admittedly, shopping malls nowadays serve as multi-functional places which combine fashion clothes stores, cinemas, supermarkets and so on and do make people's life more convenient. As one of the trendiest landmarks in the cities, people, especially the young, would normally spend at least three hours inside once they enter a mall to consume time at the weekend. As a consequence, individuals are likely to spend hours watching a shallow commercial film and taking pictures in an internet-famous restaurant instead of visiting museums, having picnics with families or learning to play new instrument.

Further and even more importantly, spending overmuch time in shopping malls is likely to exacerbate the prevailing consumerism, which doesn't seem to impact positively on the society. In a world where people take consuming as the measurement of happiness, the passion for buying goods is becoming stronger and stronger. Accordingly, even window shopping in a mall could inevitably lead to some unnecessary consumption. Even though obsessing fancy and exquisite objects can bring temporary satisfaction, it sometimes culminates in less saving, longer-hour working, more debt and even mental illness. In other words, despite the delight of insensible consumption, its long-term effects on the whole society are generally adverse.

By way of conclusion, youngsters are not supposed to spend the majority of their free time in shopping malls given the negative influences on both personal and social level.

观点类 商品相对便宜优缺点分析

Nowadays people live in the society where consumer goods are relatively cheaper to buy. Do you think its advantages outweigh its disadvantages?

范文:

Due to the fact that the world is undergoing various changes in recent years, there has been a widespread phenomenon that commercials have become much cheaper than ever before. Some people maintain that this tendency brought about more benefits, and I personally agree with this idea.

The first merits is that this enables consumers to have better working conditions and to purchase goods that they could not have bought before with limited funds, such as computers. Many years ago, the price was too expensive for ordinary people to buy, but now after the price drops, computers can be owned by people, which is convenient to improve efficiency. Apart from the better living standard, another advantage related to this phenomenon is that this would prompt the sales of the products, by which I mean enterprises control the market or increase market share through price reduction, such as penetration pricing. Penetration pricing refers to that enterprises set the price of their innovative products relatively low to attract a large number of customers and improve market share, which would enhance the reputation of the commercials in a relatively short time.

Admittedly, many people think that the demerits of low price of consumer goods are: the vicious price reduction of businesses destroys the order of competition. In other words, after the price reduction, many businesses have to steal the use of information materials and turn out of material products in order to make profits, which ultimately damages consumers. However, the laws of many countries severely punish unfair competition. At the same time, those producers who cut corners will be severely punished, such as Sanlu milk powder in China.

In conclusion, despite the drawback that the cheaper price may bring about, I still firmly convinced of the benefits of this tendency mainly because of the enhancement of living standard as well as expansion of the products.

观点类 年轻人在业余时间逛商场有负面影响

Many young people today spend much of their free time in shopping malls. Some people think it has many negative effects on both young people and the society they live in. To what extent do you agree or disagree?

范文:

Malls are attracting a growing number of young shoppers by creating favorable perception of the mall in terms of convenience, variety, awareness of brands, aesthetics and hedonic factors. I personally agree that too much exposure to an enormous range of products and services in most categories, there are more negative impacts on both young people themselves and the society as a whole.

Admittedly, shopping is often regarded as a way to relieve negative feelings such as depression, anxiety, anger and so on, but little do people know that the relief is ephemeral and damages are likely to occur, especially in the case of young people. In fact, one obvious phenomenon nowadays is that people are losing the ability to live a life without materialistic joy. Worse still, if excessive time is spent in shopping malls, the younger generations who are prone to behave irrationally will fall into the trap of impulse shopping, which may well result in over spending and shopping for things that are not necessary. Unless they have got decent income or fantastic savings habits, those consumer goods will sit on their credit card for a long time.

Meanwhile, society is unavoidably sharing the risk of the youth spending too much time in shopping mall. As the youth is increasingly surrounded by various products and service there, their desires of material grow as well. Despite a temporary boost in the economy, in the long run financial problems including bankruptcy, debt and even theft will occur when young consumers find themselves in big debts and financial crises when they are unable to pay back and the economy and stability of society will suffer accordingly. For example, many young people turn unemployed when they are less motivated or unable to perform their duties as they are paying more attention to over consumption or substance abuse. Cases where young people have to steal from their boss or the company's money to cover up their expense are no longer rare.

In conclusion, although it appears to be a harmless fun for young people to go to malls more frequently than before, it is evident that if they are not better equipped to quash down any emotions that try to convince the rational part of their brains, especially when they are not financially comfortable, both the individual and society will be negatively affected.

混合类 购物成为一种娱乐

In many parts of the world, shopping is no longer just buying what you need. It has been transformed into a form of entertainment. Why does this happen? Is it a positive or negative development?

范文:

In the modern society, the purpose of shopping has altered, from satisfying the basic needs of daily into a kind of entertainment. It seems to me that the transformation of purchasing habits as well as the development of shopping industry are the two main reasons that may contribute to this phenomenon.

With the growth of income and the technological advances, people's shopping behaviors has converted considerably. On the one hand, with the increase of income, apart from satisfying the daily basic needs, people have more disposable income to meet more needs. Meanwhile, with the full popularity of the network, people are no longer satisfied with the products and discounts pushed to them by the outside world, but take the initiative to open the shopping application, and then look for products. They see it as fun, many times a day. Second, there are also many changes which have taken place in the shopping industry in recent years, regardless of online or offline shopping, by which I mean both offline and online platforms provide entertainment while shopping. For example, most shopping centers have become multi-functioned, including parent-child entertainment and catering; and the emergence of online shopping centers and live broadcast also increases the interaction between sellers and buyers, during which process most shoppers can feel great happiness.

From my perspective, this is actually a beneficial development. This change better meets individual needs. Under the increasingly fierce competition pressure, after the work, people can wander around the physical mall, and even if there is no consumption, they can also shift attention from the work after watching a large number of goods, thus releasing the work pressure. Moreover, this change has substantially increased the vitality of the market. For example, shopping has become entertainment in China for years, which greatly promotes the sales of goods. On November 11 every year, mall shopping, the largest online shopping platform, not only makes people feel the joy of buying discount goods, but also makes annual sales increase. In view of this shopping festival, mall platform also held a party with the same name and invited many celebrities to facilitate the selling. Buyers can even buy their favorite star's clothes directly, which greatly stimulates consumer behaviors.

In conclusion, I personally believe that the transformation of shopping purpose brought about enormous benefits mainly because of better satisfaction of personal needs as well as the stimulation of the marketing sales.

观点类 购物习惯受什么影响

People's shopping habits depend more on the age group they belong to than any other factors. To what extent do you agree or disagree?

范文:

Shopping has become a national pastime in many countries and people's buying behavior has recently received long overdue attention as a social issue. It is seemingly evident that young people have different shopping ideas, compared with the elders as they pay more attention to enjoyment and pleasure in their shopping experience, while elder people attach more value to actual shopping results and commodity price. Still, I believe it is arbitrary to jump to the conclusion that age imposes the major influence on people's buying habit.

In addition to age, gender is an indispensable factor. Researchers cannot afford to ignore when they attempt to dig into consumer behavior. Generally, shopping is ideally the hobby of the females. Females "love shopping", they are naturally programmed to invest in their desires and relish happiness in return. As study says, "Men buy for their needs and women shop for their wants". When shopping, females also behave in a different manner as that of the males. They like their female friends to accompany them whereas males prefer shopping alone.

Furthermore, the needs, processes, and selection that the human brain goes through when making a purchase are often far more complex than the buyer might imagine. A bunch of other factors such as personal history, cultural considerations and psychological factors need to be taken into account. Some people buy certain brands to support their personal or professional image. Specifically, some buy products that are either perceived as fashionable, trendy or high class or that fit into a particular subculture or peer group. Some people make their purchase decision when tempted by product variation and price competition, as they are prone to be persuaded by those promotional strategies and tactics such as posters and banners during the sales period, advertising bursting in the radio and television, which is quite common among all age groups.

Based on these insights, there is a need to examine the phenomena in a further and more comprehensive context. Before that, I am inclined to believe it is the interaction of these factors that shapes a person's purchase pattern and dictates how they make buying decisions.

报告类 越来越多的人喜欢买名牌

More and more people want to buy famous brands of clothes, cars and other items. What are the reasons? Do you think it is a positive or negative development?

范文:

Buying brand name products these days seems to be no longer uncommon. The reasons behind this buying behavior of the customers are not only related to the physical appeal of those goods but also the strong emotions that we attach to them.

People buy brand name products for a variety of reasons. Generally, consumers generally buy famous brand products in hopes that it provides an excellent quality experience, as, in most cases, recognized brand names typically have shown a consistency in product quality. Apart from that, people have a desire to fit in, whether at school, work or in social circles. For this reason, people buy brands because they believe it will contribute to greater social acceptance or support their personal or professional image. Or sometimes it is simply because of a sense of brand loyalty. Take Apple Inc., for example, consumers wait overnight for new releases and have immense brand loyalty even though the latest products are not technologically unique or superior.

Although it is always been a matter of personal choice and consumers' nature to own the finer things in life will likely never change, this will unavoidably result in some negative consequence. If this tendency continues, people will easily fall into irrational buying behavior. People tend to look at the positive elements of a brand product while ignoring its disadvantages and perceive non-famous brands as inferior, even though those famous brand products are proven to be no better than their affordable counterparts. Worse still, it is well known that consumers clearly do not always act in their best financial interests. The physical appeal of these brand products is undeniable – the leather is softer; the cars are more comfortable – but the price tag is often off-putting. Unless people have got decent income or fantastic savings habits, those consumer goods will sit on their credit card for a long time.

In conclusion, although it appears to be a harmless fun for people to buy brand name products, it is suggested that they are better equipped to quash down any emotions that try to convince the rational part of their brains, especially when they are not financially comfortable.

范文 2:

The security on both the quality and aftersales of commodities, together with the market orientation from the commercial titans, have impelled people's shopping tendencies leaning to items with a relatively famous label, for better more than for worse.

The huge purchasing power on famous-brand products objectively is caused by reasons of consumers' search for guarantees on the one side, and of the market system of consumer goods lying behind on the other. Obviously, buyers would more likely to believe that products derived from a big brand would be more secured in terms of the quality, safety, or even the aftersales services. There is always a reason why business giants like P&G, BMW or Levi's can earn such a telling share of the market in their related industries--Quality tells, from the perspective of the consumers--and they certainly deserve the trust from their advocacy, since once they have a longer lifespan than do their rivals, they must outperform others in at least one aspect, mostly the perfect quality or the heartfelt services. Though hundreds of complaints arise yearly on FMCG, barely do the incidents come from the titans from every commercial area. What is more, people would be guided severely on their values, or purchasing desires by commercial activities of those mega brands. The capital base of those famous ones allow them to pay more attention to covering their brand cultures, their values, or their product attractiveness overwhelmingly to the public through multiple marketing actions like advertisement, charities, tv show or movie investments, for rooting their impressions deeply inside the mental inward of their potential customers—and that is the possibility of once purchasing desire—to make sure that their products are the most competitive one in the good market.

Whereas there are always superiorities dwarfing the ignorable shortcomings. Though there may exists a concern that if people only care about fame, and if the commercial revenues solely benefit the famous brands, monopoly may come out of the horizon when the market is dominated by limited magnates, and darkness would be soon manifest: the commerce will deviate from transparency due to the independent pricing, and acts may play evil in collusion after horizontal integration. However, the market would still be purified, since on the one hand, macro manipulation still works, and one giant would always be checked and balanced by another on the other. Conversely, the mainstream of the commodities would always be controlled seriously if the public help to the positive natural selection, because tycoons know better how to make mutual interests between the consumers and themselves within the product chains by searching a balance among sales, costs, profits and more importantly, qualities and services.

In conclusion, the preference to famous labels of the public is mainly sourced from the objectivity of goods and market per se, and it is always a good thing to promote this to happen.

混合类 容易受到时尚影响

People nowadays are more easily influenced by fashion, especially on their clothes and hairstyle. What factors lead to the phenomenon? Is it a positive or negative trend?

范文:

In the modern society, a growing number of people, especially young adolescents, are more easily influenced by fashion. It seems to me that the advancement of globalization and the promotion of people's living standards are the two major reasons for this tendency.

The first reason why more people are pursuing the fashion trend is that in the wake of globalization and the popularity of the Internet, people's thoughts and choices have become more similar than before. In other words, people begin to understand the cultures of different parts of the world and yearn for it, especially for the fashion trends in well developed areas with a wide range of high-end brands, whose fashion trends are highly recognized and imitated. Meanwhile, the improvement of people's living standards has enhanced people's purchasing capacity simultaneously. With more disposable income, people not only satisfy their the daily consumption, but also have high requirements for their own clothes and hairstyles.

Personally, I believe this is actually a detrimental trend. First of all, this may lead to irrational consumption easily. At present, the fashion trend is mostly dominated by high-end luxury brands, and the average price of each clothes is more than 10 thousand. However, even in the metropolis like Shanghai, the average wage is only about 9500, by which I mean that when more people are influenced by fashion and choose big brands, many people may be forced to purchase goods which are much higher than their purchasing capacity just in order to integrate into the group. Otherwise, they may become complete outsiders, or even be discriminated against and insulted.

Apart from the unrealistic pursuit of extravagant way of life, the increasing recognition of fashion trends may also undermine the development of people's individuality, which may ultimately lead to the simplification of aesthetic. For example, with the process of globalization which is further accelerated, more and more oriental people are very keen on the design of Western brands. However, it is worth noting that there are great differences between Westerners and Orientals in body shape, color of skin, temperament and so on, which leads to many Orientals wearing western fashion brand clothes and hair accessories that cannot achieve the ideal effect. At the same time, this trend have also result in the underdevelopment of eastern fashion brands, especially newly emerged ones, which may eventually give rise to the simplification of aesthetic.

In conclusion, I personally believe that this phenomenon will bring more unfavorable influences on individuals. Therefore, I strongly recommend that people should have their own critical thinking before making purchases.

公众号：雅思情报圈

观点类 人们倾向于模仿别人

The tendency of human beings to copy one another is shown in the popularity of fashion in clothes and consumer goods. To what extent do you agree and disagree?

范文:

Human beings are naturally inclined to imitate. For example, children learn and grow up by simulating their parents. Some people maintain that people's habit of imitating others has been shown in fashion trends and the use of goods. Personally, I totally agree.

First of all, in terms of fashion tidal, it really reflects the tendency of human beings to imitate others. For example, in the modern society, a growing number of people, especially young adolescents, are more easily influenced by what celebrities wear and use, especially fans will feel special power by wearing the same or similar brands as their idols, which is a clear sign that human have a tendency to mimic others. This is why companies are willing to hire stars to speak for their products, even if they have to pay high endorsement fees, so as to greatly promote sales.

Besides, in the wake of globalization and the popularity of the Internet, more people are pursuing the fashion trend, and their thoughts and choices have become more similar than before. In other words, people begin to understand the culture of different parts of the world and yearn for it, especially for the fashion trends in economically developed areas with a large number of high-end brands, which people tend to be very recognized and keen to imitate. Moreover, some people will regard wearing fixed brand clothes and matching as one of the important criteria to measure others' social status, and those who do not meet the criteria may be underestimated or even excluded by others. Therefore, sometimes people have to imitate other people's clothes and products.

In conclusion, I personally believe that this tendency is actually shown in the prevalence of fashion and daily consumption. However, What I strongly recommend is that it is better for people to have their own critical thinking before making purchases.

混合类 人们丢掉旧东西的原因及影响

Nowadays, people always throw the old things away when they buy new things; whereas in the past, old things were repaired and used again. What factors cause this phenomenon? What effects the phenomenon leads to?

范文:

It is not uncommon to notice people would discard their previously owned things to buy the new ones instead, especially in developed areas. The technological advances and the promotion from the sellers may be the major reasons that contribute to this phenomenon.

To begin with, the advancement in technology enables the mass production and the cheaper price of buying things. Recent years witness the huge progress in the improvement of production efficiency, which produces a variety of commodities in a relatively cheaper price than they were in decades ago. So, it would be more likely for them to throw old things away instead of repairing them. On the top of that, the promotion on the media could be another reason for this trend. Various advertisement on the Internet or TV keep persuading us to buy the latest products. They lure us to update our belongings by presenting their new functions and the gorgeous appearance. Hence, the consumers may catch the trend and discard the old ones.

This phenomenon could bring about the consequences from different aspect of our society. As for the environment, the rampant production could speed up the exhaustion of the natural resources; the waste we throw away may aggravate the pollution of our surroundings as well if we cannot recycle them appropriately. Besides, this way of living also encourages the consumerism and irrational consumption, which may lead to the prevalence of money-oriented mentality. People may try to buy anything they want regardless of their financial status and overlook what are the really valuable things in their lives.

In conclusion, the reasons contributing to the “throw-away” society varies, and it has many potential drawbacks.

范文 2:

Nowadays, the idea of repairing a gadget, appliance or hardware is getting obsolete. More people opt to go for new ones than in the past once their products go faulty. This essay seeks to find the causes behind this change and throw some light on some possible consequences that have taken place accordingly.

There are several reasons contributing to this throwaway culture. Notably, compared with old times there has been sharp fall in cost of and enhancement in efficiency of manufacturing industry, which make these items a lot cheaper and more accessible. Meanwhile, repair cost is always on the higher side as many companies charge highly on service even for just opening or simply inspecting the products for problem. Hence, the differentiation between the cost of replacing the products and repairing it is evaporating. Also, the availability of spare parts has comparatively become more difficulty. As a result, people in most cases, are discouraged by these facts and are more easily tempted by newly launched products with advanced versions or features than their predecessors.

For some, this trend could be regarded as a boost to economy. However, the cost to the environment is borne as throwaway culture become increasingly prevalent. This mass consumption facilitates problems rising from mass production, processing and disposal of discarded ones. During the process of manufacturing, raw materials and energy, many of which are not renewable or regenerate, are extracted brutally from nature and produced in a very polluting way. Besides, the production growth is often based on planned obsolescence and increasing level of waste, which is a problem in itself, as those wastes are probably just dumped into the rivers and oceans and harm the ecosystem and creatures that live in the sea. Worse still, in most cases, the wastes are involved with toxic or plastic materials, which means they remain a threat for many years to come.

In conclusion, many factors are responsible for the shift of people from repairing to buying, and this seems to be an inevitable stage currently. Still, it is important to draw the public's attentions to those negative impacts resulting from this phenomenon.

利弊类 大型购物中心比小商场更受欢迎

Large shopping centres and supermarkets become more popular than small market. Do you think this development is positive or negative?

范文:

As billions of currencies rolled in, so did the plaudits: large, famous shopping centers seemingly were making the world a better place. Today, those commercial titans are accused of being anti-competitive and destructive to democracy; meanwhile those market with limited scales have to struggle with their lives under the darkness provided by the larger ones.

Big commercial platforms, particularly dominant shopping malls and supermarkets, do indeed raise a worry about fair competition. That is partly because they often benefit from the capital chain: they have the ability to purchase batches of products from their wholesalers with an extremely optimistic price—and they surely do—due to their large volumes of needs and stable reputation; they can establish fire sales for some goods, even with the prices lower than any other rival anytime whenever wanting to expand the market share; they sometimes even produce their own commodities and they have the perfect resources to do that—increasingly, they are the market itself, providing the infrastructure (or “platforms”) for much of the concrete economy. That puts a deadly blow to small businesses, who are always fighting for every hardship brought from their “giant friends”, during which those limited, infamous startups exhaust themselves competing for a slice from the mouths of those titans in the market, because they seldom have the power of lowering down prices or investing propagandas as that much as do those malls with magnificent labels; monopolies then manifest with an unstoppable trend.

Even though this is witnessed clearly by authorities and economists, the lack of simple and effective solutions leaves politicians impotent. In the past, they have tackled monopolies either by breaking them up, or by regulating them as a public utility. Today both those approaches have big drawbacks: the traditional tools of utility regulation, such as price controls and profit caps, are hard to apply, since modern trading modes make commercial titans extremely easy to escape the barrier forced on costs and final prices—they can always find a way to make profits through bringing their clients more convenience than the small service providers by, say, using electronic commerce or faster and cheaper logistics; the reaction conversely would come at a high price in forgone investment and innovation. Likewise, a full-scale break-up would cripple the platforms’ economies of scale, worsening the service they offer consumers. Even then, big brands still are out there; in all likelihood the dismembered scales of them would eventually outperform those truly small businesses and sweep all before it as the inexorable logic of brand effects reasserted itself.

In conclusion, the detrimental effects would definitely be provoked by consumers' increasing preference to large shopping centers, and it is still hard for related administrations to deal with it.

观点类 对有钱人而言最重要的事是帮助他人？

Some people think the most important thing about being rich is helping other people. To what extent do you agree or disagree?

范文：

It is asserted that the most important thing for affluent people is to use their surplus wealth to help others, while I want to acknowledge how arbitrary this notion is.

Although great wealth does come responsibility, helping those who are needier cannot be objectively defined as the most creditable one. Individuals' attitudes towards the creation, accumulation and disposal of wealth will depend on their cultural, social and family influence, their religious affiliation, and the social welfare available where they live. Each person will form their own philosophy based on these influence, and naturally and inevitably these philosophies vary considerably.

Besides, the wealthy do not have special obligation to help the poor, unless they choose to do so. They are entitled to keep their wealth or have their own plans to dispose their wealth, as it is a result of their hard work. People earn a great deal of money is because very few people can do what they do. They have gone through a unique journey of ups and downs to grow and learn what enable them to acquire skills and assets. It remains a personal option whether to spend lavishly on parties or luxury yachts.

In conclusion, it would be ill-considered and narrow-minded to deem that the act of helping others is the priority of being rich, especially when in fact, they are contributing to the society in many aspects, as the higher tax collected from the rich is used to keep communities clean and safe, and to give the public education and healthcare, or those entrepreneurs and businessman are making investment to open more plants and create more jobs.

混合类 来自富裕国家的年轻人去做义工的原因

More and more young people from wealthy countries spend a short period of time in communities in poorer countries doing unpaid work (teaching and building houses). Why have they chosen to do this? Who is likely to benefit from this kind of work?

范文:

It is a famous sentence in ancient China that “if you are poor or lacking knowledge, help yourself out, while if you are rich or knowledgeable, then help others out.” Indeed, there are a growing number of young people who chose to go to underprivileged countries to do free volunteer work for a short period of time. It seems to me that the desire for self-awareness and the willingness to help others are the two main reasons for this phenomenon.

The first reason why young people make such a decision is to have ego-enhancement. In recent years, with the world peace and rapid economic development, more and more young people lack a clear understanding of future life planning and self-worth in the face of relatively stable study and work life. By participating in international volunteers, he can feel the gap between the rich and the poor in different countries, and find that his philanthropy can help the local people and get a good response. Then when he returns to his country, he will know exactly what he wants. The second and more important reason is to convey love. Most of the children who take part in international volunteer work come from families with religious backgrounds, such as church schools. Religion is promoting a spirit of equality and fraternity, which has prompted more and more young people to participate in projects to help poor countries.

Many people would benefit from the existence of volunteer activities. First, there are many benefits for young people themselves. In the process of doing volunteer work in the local area, young people can not only have a deep understanding of local culture, but also make friends with people from different cultures of various countries through interacting with other volunteers and inhabitants. Second, local welfare institutions and local citizens can also get more benefits. Although young people do volunteer work for free, they usually need to pay a certain amount of daily expenses to the organization before starting. In other words, not only will volunteers provide free labor force to the local area, they also offer certain financial support to the local community.

To summarize, helping others is not for a line on your resume, or for your own sense of moral superiority. I hope every volunteer activity can play a crucial role in the world.

范文 2:

An increasing number of college students and graduates from developed nations choose to do voluntary work in third world countries. A lot of people wonder why this trend is occurring and who is going to benefit from these young people's commitment. I will try to answer both questions in the following paragraphs.

In terms of the first question, I think globalization and the wider internet access are the contributing factors behind this trend. In those days well before the onset of globalization and the internet, a lot of considerate and caring youngsters from rich countries found it very hard to participate in meaningful overseas service work because without adequate sources of information about international volunteering, they didn't know where they were needed and what they could do to help poverty-stricken areas in developing countries. Even if they did, they would soon figure out that where they were needed most, more often than not, were unsafe or inaccessible due to high travel costs or the absence of transport systems. However, things have changed today. As the globalization proceeds, international travel becomes more affordable and available than ever before. At the same time, worldwide internet coverage makes it easier for young people to identify reliable and rewarding international service schemes, which match their abilities to the most needy communities. These two factors combined prompt a growing number of young people to reach out to the places in desperate need.

Who is going to benefit from volunteers' work? From my perspective, both volunteers themselves and the communities where they serve will do. On the one hand, young people's efforts will definitely change locals' life for the better. They offer better education for local people, make the medical care more affordable and accessible, improve local sanitation condition and even empower girls and women struggling in backward and patriarchal societies. On the other hand, these young humanitarian workers also reap a lot from volunteering trips: making new friends, eating exotic cuisines, picking up a foreign language, and enjoying natural landscapes, all of which enrich their life experience. Plus, volunteer experience looks good on college and job applications so that young people with these kinds of service experience are more favored by employers and university admission officers.

In conclusion, globalization and wider internet access are the reasons behind this trend and volunteers' work will benefit both themselves and the local communities where they live and work.

观点类 计划未来是浪费时间

Some people say that it is a waste of time on planning for the future and that it is more important to focus on the present. Do you agree or disagree?

范文:

The core factor lying behind the argument of whether it is meaningless to plan future, or whether dealing with current problems is of greater significance may source from the understanding of “waste”. Some may consider it casually as to “do things that may have no results or no short-term practicality”, but this may rest entirely on their shallow definition.

Indeed, the seemingly useless essence of paying attention to future and the strong willingness of focusing on current situation may be held by those with rankest utilitarian psychology. To them, any thing that may not directly contribute to the immediate benefits are deemed “waste”; the plan to the future is largely proved to no avail. We would be insistently testifying whether spending time on collecting data and doing research for scheduling the prospective steps does perfectly fit the real coming days, or whether sometimes the trial and retrial on the future possibilities are still with uncertainty, for this per se, is just a projection building an unknown path. Sadly, however, the contradiction between what is hypothesized and what the empirical data suggest often sends those striving for the future back to the drawing board. Besides, plans like this, in their opinion, are not urgent enough as pressures addressed by present: famines are experienced severely by people in desolate places, and medical breakthroughs are awaiting curing those enduring physical painfulness, and the efforts involved in these, even though also oftentimes with hardships, would sound more practical than squandering time, manpower and energy on those “visionary things”.

The claims exhibited in the aforementioned paragraph may somewhat be too simple-minded, if at all; they are also the just the state of mind precluding the masses from looking at world from a macro perspective, and robbing them of the opportunity to recognize the potential underlying the solid development of the entire society. Predictions, and preparations for the future, are just the root of people achieving progresses, and of the existence of new technology revolutionizing the world towards the brighter milestones. As the current problems may already have posed great pressures to the present public, how can we guarantee that there would be no more dilemmas when the “future” came to the “present”? and that we civilized human beings, are not building our current foundation of the social paces on the successful plans to the future made by prior pursue of our predecessors? Nor does the present issues be properly tackled without the long-term visions; we may be severely distracted from the way it should be by the short-sighted solutions provided they are considered more important than the validity of pacing to the long run: recklessness is just the consequence we may see when all the resources are imposed with no sustainable thought, and when

environment is highly blighted irreversibly for marrying natural materials just with the contemporary needs.

In conclusion, it is the improvident argument that compels me to entirely oppose the absurdity made by the topic, and I strongly endorse the rational and durable mindset injected in people dealing with the problems existing around the world.

公众号：雅思情报圈

双边类 计划未来 vs 着眼现在

Some people prefer planning for the future while others argue that we should focus on the present. Discuss both views and give your own opinion.

范文:

People have different views about whether we should make plans for the future or stay focused on the present. While I accept that having a plan can be essential in achieving life goals, I believe that the key to happiness lies in living every moment.

On the one hand, having a defined plan can be extremely helpful in reaching personal goals in different aspects of one's life. For example, planning a career path can almost certainly lead to a satisfying working life. Many people decide as young children what they want to do as adults, and it gives them a great sense of satisfaction to work towards their goals and gradually achieve them. Many children dream of becoming doctors, but to realise this ambition they need to gain the relevant qualifications and undertake years of training. In my experience, very few people who have qualified as doctors choose to change career because they find their work so rewarding, and because they have invested so much time and effort to reach their goal.

In spite of the above arguments, I believe that people find happiness in focusing on their everyday life. Many people who have planned out everything and achieved a series of different goals, having gained wealth and high social status, end up finding themselves not happy later in life and have to go to therapists. There are also a lot of people who have not achieved much but live a happy life, focusing on the hustle and bustle of their families. Moreover, all kinds of plans suffer from the risk of falling through, especially in modern society where changes are happening at a frequency never seen in human history.

In conclusion, although there are benefits to making plans for life, I support the view that one is more likely to find true happiness by focusing on the present.

混合类 雄心壮志对成功的重要性

Ambition is being emphasized in today's society. How important do you think it is for people who want to succeed in life? Is it a positive or negative characteristic?

范文:

Ambitions seem to be the key to one's success, since ambitious people can find motivation to work hard and achieve their goals. I agree with this view, although they have to make some personal sacrifices on the road to success.

Ambitions can encourage people to work harder, which enables them to achieve their goals more easily. Success comes at a price, and people cannot attain their objectives unless they devote effort to reaching their targets. They tend to be self-disciplined and diligent as they are driven by their aspirations. They will continue to sharpen their skills, develop expertise and gain experience until they can reach the top in industry. Without ambitions, however, they could have given up if there were any challenges on the road to success.

Ambition is a valuable personality trait in the sense that it makes people optimistic and drives them to achieve success. Those with aspirations normally imagine the outcomes of being successful, so they would not feel frustrated or hurt in the face of adversity. This positive mental attitude can prompt them to achieve their potential and pursue targets which are otherwise unattainable to them. Their successes not only reward them well in financial terms but also contribute to social progress.

On the other hand, if people have high expectations of their achievement but fail to achieve their targets, they would feel disappointed and exhausted. They may have undue expectations over their accomplishments, but sometimes, it is not easy to implement their plans. Sometimes, ambitions may lead to wrong judgements, and push them to set unrealistic goals. Failing to meet targets may engender a sense of disappointment or self-doubt, and it can even evolve into mental disorders for people who have difficulty in managing stress.

公众号：雅思情报圈

双边类 成功源于努力还是天赋

Some people think success in life comes from hard work and determination, but others think there are more important factors like money and appearance. Discuss both sides and give your own opinion.

范文:

While some people recognize the industrious work and resolution as the most important means of reaching personal goals, others believe that material value and how they look are more important. It looks to me that neither opinion illustrates the entire picture and it is therefore simplistic to venerate either view over the other without scrutinizing all determinants.

I have to say that it is oversample to label industry and determination as the key to success in career. Admittedly, it is not surprising such a belief is deeply ingrained in minds of people from less the well-off class, who have no choice but resorting to the two attributes to achieve their aims. Nevertheless, those who think in this way are oblivious to the concern of the upper middle class, many of whom do not have the same apprehension about basic needs in everyday life or lifelong ambitions to fulfill. In this respect, it is not easy to expect those with affluent backgrounds to share the same value and outlook as their counterparts living under the stress of livelihood and career prospects.

While people from well-off status are less likely to be industrious, it does not necessarily mean that money and appearance are more important than other qualities. The problem with the rhetoric resides in the ambiguity of the term 'more important' – the descriptor represents something that cannot be defined by a general accepted criterion; rather, its justification is domain specific and context dependent. Personal wealth and the way people look undeniably remain the key indicator for someone to be nominated in the Forbes list; however, when reading the articles behind those glossy magazine covers, we still see the traditional values that stand at the heat of their successful stories, such as their perseverance, hardworking spirit or resilience against failures.

Taken collectively, it is my conclusion therefor, it is generalized to place more emphasize on either industry or materialism while ignoring the contexts.

混合类 哪些因素导致国家成功

Economic progress is often used to measure a country's success. However, some people believe that other factors are more important. What other factors should also be considered when measuring a country's success? Which factor do you think is more important than others?

范文:

The relative success of different countries is usually defined in economic terms. There are several other factors, apart from the economy, that could be used to assess a country, and in my opinion education is the most important of all.

Standards of education, health and individual human rights should certainly be considered when measuring a country's status. A good education system is vital for the development of any nation, with schools, colleges and universities bearing the responsibility for the quality of future generations of workers. Healthcare provision is also an indicator of the standard of living within a country, and this can be measured by looking at average life expectancy rates or availability of medical services. Finally, human rights and levels of equality could be taken into account. For example, a country in which women do not have the same opportunities as men might be considered less successful than a country with better gender equality.

In my view, a country's education system should be seen as the most important indicator of its success and level of development. This is because education has a considerable effect on the other two factors mentioned above. It affects people's health in the sense that doctors and nurses need to be trained, and scientists need to be educated to the highest levels before they can carry out medical research. It also affects the economy in the sense that a well-educated workforce will allow a variety of companies and industries to flourish, leading to trade with other countries, and increased wealth.

In conclusion, nations can be assessed and compared in a variety of ways, but I would argue that the standard of a country's education system is the best measure of its success.

双边类 经济发展是国家成功的唯一因素

Some people believe that economic progress is the only factor that can be used to measure a country's success. Some others argue that there are some other factors. Discuss both views and give your own opinion.

范文:

Criteria vary when evaluating a country's success and prosperity. While economic progress is of course essential, I tend to believe that other factors are equally important.

There are three key reasons why economic growth should be considered as a fundamental factor for countries. To begin with, a healthy economy could create numerous job opportunities. citizens could be employed and earn decent salaries to live a comfortable life. Next, the economic progress ensures that government could allocate a large amount of its budget to the infrastructure construction. For example, transportation and the medical care could be improved if a country's revenue is high. On the top of that, the developed economy could give a country priority on the global stage especially when they have global trade with other countries, which also could create a virtuous cycle for the economic advancement.

Nevertheless, I would argue that other measures are just as significant as the economy mentioned above. In particular, the natural environment should be taken into consideration. It is not uncommon to see that many countries sacrifice their environment for the sake of economic progress. Air, water and soil are contaminated because of mass production and illegal discharge of pollutant. Hence, it is partial to value a country's success without considering its ecological balance. Another contributing benchmark could be the education. It is the major reason for a country's sustainable development. A high-level education could produce talents in various fields without worrying about the deficiency of labour, which could act as a catalyst for the long-term economic boom since we are now in a knowledge-based world. Universal education also could be beneficial to lower the crime rate and build a harmonious society.

In conclusion, while economic is the crucial marker of a country's success, I believe that environment and education are equally significant.

利弊类 经济发展导致社会价值缺失

Many countries aim to improve living standard by economic development, but some important social values are lost as a result. Do you think the advantages of economic development outweigh the disadvantages?

范文:

In the modern society, living standard of citizens has been promoted as a result of economic surge, while this inevitably results in an apparent loss of some social values. It seems to me that the demerits of this tendency outweigh the merits.

The first obvious drawback is that it will tempt people, especially young adolescents, to cross ethical lines or even break the law for the sake of economic interests. For example, in order to satisfy material desires, young people will apply for the loan without financial basis, and some of them even uploaded nude photos so as to acquire more funds, which may be potentially fatal for their future development. Furthermore, the lack of values will seriously undermine the harmonious atmosphere of the society. Some large enterprises gain enormous wealth through vicious competition, which leads to small and medium-sized enterprises suffer economic losses or even bankruptcy. Meanwhile, in order to survive, other large companies have no choice but to go with the flow and utilize the same means to compete despite the impairment of social value. As a consequence, the whole industry gradually forms a monopoly situation, which eventually leads to the stagnation of social development.

Admittedly, thanks to the enhancement of living standard brought about by the economic growth, some of the social problems can be effectively dealt with. For example, with the social advances, the bread-and-butter issues in underprivileged areas can be effectively solved, which greatly enhances the well-being of local people. However, it is worth noting that in order to get rid of poverty, some areas do not adhere to the basic values. Although this can bring temporary economic prosperity, the accompanying problems, such as environmental pollution and land desertification, determine that their development cannot last long.

In conclusion, there is no straightforward equivalence between economic progress and social well-being, by which I mean although people can have material improvement owing to economic development, social values have been suffering.

We favour the well-being and progress, not the annihilation, of mankind, so I strongly recommend that the government should strive to become the constant defender of traditional values, but just focus on the economic growth.

观点类 工作时长更久的国家发展更好

Countries with a long average working time are more economically successful than those countries which do not have a long working time. To what extent do you agree or disagree?

范文：

I would argue in this essay that there is no clear correlation between the average working time of a country and the economic success level of it.

The economic standard of nations and their working hours of labor forces are not proportional at all; the complicated reasons lying behind the working time and the multiple factors leading to economic development compel the claim to be ridiculous. Before assessing whether an element contributes to an outcome, one should first find out the internal system of the causality; in some cases, longer working time in a country solely reflects the fact that its labor forces may not be as developed as that in other countries. In other words, they may have to increase the working hours of laborers because they are not as efficient as places that are, say, technologically prosperous in terms of productivity. Such a situation explains why time length cannot be a measurement in judging economic success: sometimes countries with longer average working time are the counterexample of more economically successful ones.

Before evaluating whether countries can be compared in terms of their economic success, we must provide credible standards that can successfully do this job. However, there are no even plausible measurements used to find out the answer. What is the quantifying parameter we consider to measure the success of a country in terms of economy, or should I say, what is the true meaning of "economic success"? Should we measure the total GDP or per-capital GDP of a nation? Or can we compare the CPI or the import-export volume? Results may vary with different criteria, and even if there are confirmed statistics, the conclusion may still be biased because they cannot persuasively reflect whether they are "economically successful". The GDP of the entire country may be high because of a large population, and a higher per-capital GDP may hide the wealth disparity inside; other measurements may still have problems like this. Though some countries have significant gaps in terms of economic prosperity, there are lots of difficulties out there when we attempt to compare countries that are not so different in their economic development.

In conclusion, it is simple-minded to add working time into consideration of whether countries are more economically successful or not; the economy of nations is also hard to be compared because of no persuasive standards.

报告类 贫富差距变大

Nowadays, the gap between the rich and the poor is becoming wider in some countries of the world. What problems can this situation cause? What solutions should be taken?

范文:

It is undeniable that an appreciable gap between the rich and the poor is mainly the outcome of inequity in the distribution of wealth. This widening gap inevitably ushers the dawn of a vicious socio-economic climate that causes deterioration in social stability as well as individual wellbeing.

Unequal distribution of wealth is usually the twin phenomenon of a worsening socio-economic gap. It creates a societal situation where the value system places too much importance on what a person possesses rather than what a person is, which has direct psychosocial effects on individuals, making them feel insecure about social status, exerting knock-on effects for the stress levels and emotional stability. Worse still, the gap becomes the breeding ground for social divisiveness. It alienates the poor in a discriminated manner, or even rallies them, as a class, to oppose the rich. Consequently, once it undermines social cohesion and trust in democracy, economic growth will be hampered and social advancement will be prevented.

Therefore, actions must be taken to break down the barriers between two sides and lift the poor out of poverty. To do this, an economic environment that works for everyone, not just a fortunate few is required. A new, human economy that values what truly matters to society, rather than fueling an endless pursuit of profit needs to be built and promoted. Meanwhile, policies must be implemented concerning a fair taxation for the rich and secure jobs and comparatively decent minimum wages for everyone. Besides, investment in making education widely available and affordable needs to be urged. As there is no surer ticket out of poverty than a solid education, education should be a great equalizer, not a source of division.

In conclusion, the patent inequity in the distribution of wealth is making both the poor and the society as whole suffer deeper and more control and regulation should be exercised to reverse this situation.

文化类

利弊类 各国减少差异化共同欣赏节目的利弊

Differences between countries have become less evident, so we can enjoy the same films, brands and TV programs. To what extent do you think the disadvantages of this outweigh the advantages?

范文:

As the world becomes more complex, some things do, of course, standardize and globalize, with enormous activities undertaken without reference to international borders. Some people are quite enjoying the life that the cultural globalization brings, whereas others raise doubts about this. Personally, I believe that the merits overshadow the demerits.

First of all, the exchange of culture could enhance mutual understanding, create goodwill and remove the hostility and prejudice between different nations. In the past, people who live in Europe or other regions used to regard China as a deprived place as they can only acquire the information from few Chinese films in which the protagonist in the story came from the countryside, but now with more Chinese films coming to the international stage, foreigners have a more comprehensive and objective understanding of China, even if they have never been here.

Besides, globalization is also a vital process toward transferring knowledge and products throughout the world. In other words, people can enjoy cultural achievements by artists all over the world, which substantially enriches people's daily life. Meanwhile, the commercials produced by the advanced technique can also be shared to help people deal with their everyday hassles. For example, numerous mothers, including myself, are keen to buy the Japanese cosmeceuticals for their babies as the effect of treating the slight illness such as eczema is really instant, but the prize of them is relatively economical.

Admittedly, people who are against the cultural globalization have their own reasons. After all, the cultural globalization may extinguish cultural individuality and diversity of minor countries and minority groups. In such circumstance, most people may prefer the big brands with global clout rather than the domestic brands, by which I mean nowadays the market share of the true homebred brand is limited, with only 20% or less. However, facing the fierce competition, the pressure should be converted into motivation, which makes the domestic brands find their own uniqueness and enhance the brand competitiveness.

In conclusion, it seems to me that although the globalization has some adverse influences on our lives, there are actually more benefits brought about by this tendency.

范文 2:

People from various parts of the world now can share similar brands and movies. People hold controversial views regarding to this phenomenon. In my opinion, I believe it brings more drawbacks than benefits.

Cultural globalization has its advantages. Firstly, the exchange of culture could enhance the mutual understanding among different countries. In this way, the cultural block would gradually reduce so people would have less disparities with each other. Less prejudices and conflicts would be created. Apart from this, artistic masterpieces are available for the residents in a global scale, such as those films, music, opera and so on. Hence, we have much more options to choose what we like instead of having limited choices of local programs.

On the other hand, people who are against this cultural assimilation have their own reasons. Firstly, it may extinguish the cultural diversity of the minority countries and groups. By sharing the similar TV programs and films, their own cultural identity may gradually vanish. What is worse, their languages which are functioned as the carrier of their own cultures may also die out. Therefore, if this trend continues, the cultures on this planet would be monotonous while only the mainstream popular culture would prevail. In addition, since people all over the world may use the same brands, those less well-known ones would lose its popularity, which may pose a threat to the development of their local economy, while the owner of the popular brands may monopolize this market.

To sum up, although having access to similar culture can bridge the gap between people from different cultural background, it can have damaging effects on the cultural diversity and the less-popular brands.

公众号：雅思情报圈

利弊类 过分崇拜明星

Nowadays young people overly admire media and sports celebrities. Do you think it is a positive or negative development?

范文:

It is not uncommon to see youngsters around talking about their shared idols who are either popular actors or sports stars excitedly during spare time, in the workplace or on the subway. As far as I am concerned, admiring celebrities overly is overall a detrimental trend for the young generation and society despite several benefits it may bring about.

Admittedly, from psychological perspective, it is understandable that a certain number of young people consider star worship a form of escapism and a way to alleviate their stress from daily busy schedules. Besides, some celebrities, especially top athletes with valuable qualities including persistence and diligence set a shining example, encoring and inspiring their fans to follow them for the purpose of sparing no effort in pursuing their dreams, which is a kind of positive spiritual belief to some extent.

However, I hold the opinion that this is generally an adverse trend owing to its unpleasant and overwhelming results influencing majority of youngsters. There is no doubt that the young could be immature and impulsive, a consequence that they are likely to imitate all the actions of their idols , irrespective of whether these actions are beneficial or not, ranging from a materialistic lifestyle, an individualistic way of living to more problematic behaviors such as racism and discrimination. These outcomes are negative not only for young people themselves but also for the society as a whole in the long term.

In conclusion, the youth are supposed to think rationally about star worship. Otherwise, the proclivity of admiring and even imitating these celebrities excessively may result in a wide range of unexpected effects and thus is a negative tendency in today's society.

报告类 年轻人喜爱明星而不是本国名人

Young people today know more about international pop and movie stars than famous people in the history of their country. Why is it? What can be done to increase young people's interest in the famous people in the history of their country?

范文:

It has long been a problem that younger generations are more fascinated by celebrities in vanity fair than those historic figures in text books. To me, it seems to be a symptom of a trouble to which the media and schools are the answers.

The primary culprit of this phenomenon is the misleading effect of modern media. Living in a material world today, the youth are inundated with ubiquitous coverages of pop and movie stars the world over, particularly those sensational gossips and scandals online to increase ratings. As a result, exposed to these reports for a long time, young minds are unconsciously distracted by or even get addicted to those low-quality stories.

But the problem is not the consequence of just media, the education of schools should be another reason to blame. If more adolescents prefer stars in magazine covers to the heroes in history books, chances are the education model in schools is not attractive enough for students.

However, it is not the moment to be pessimistic for the problem, while there are some practical solutions to curb this trend. Firstly, the government can have a role to play, by initiating regulations to prohibit media from over publicizing news of entertainment. In contrast, more documentaries on history and culture should be encouraged to be broadcasted more frequently. Also, schools could arrange more tours to historical museums, while teachers should share more anecdotes of historical figures in lectures, thus cultivate young students' interests in history of their country.

If these measures could be implemented, I would say the young minds would be reversed from their infatuation of modern idols. With the concerted efforts by government, media and reformed education method, a poem by Dylan Thomas could be as popular as the gossip of Beckham' divorce.

双边类 名人对慈善事业的正面效应和负面影响

Some people believe that famous people's support towards international aid organizations draws the attention to problems, while others think celebrities make the problems less important. Discuss both views and give your opinion.

范文:

People have different views about whether celebrities is beneficial to the spread of charity activities. In my view, the influence of famous figures is conducive to increase the sense of social responsibility amongst the general public.

On the one hand, it is easy to understand why some people are critical of the negative effects brought by some celebrities to charitable organizations. In the eyes of those critics, the image of many movie and pop stars is usually bound up with extravagant lifestyle featuring luxurious dresses and cars, if not negative news pertaining drug abuse or tax evasion. Considering this, it seems absurd to involve those from vanity fair in the social service for disadvantaged groups, which might disgust the majority and therefore deter the public from participating in the activity.

On the other hand, I tend to stand by those who attach more importance on the positive side of public icons, who have the magic to attract the younger generation and even politicians to join philanthropy. One convincing example we cannot afford to forget is the Live Aid Concert in 1985, which raised millions of dollars for the famine in Africa. Had it not been for those super pop and rock stars, the problem would have never been realized by the world, and thousands of people would have died of hunger and diseases. What is more important, it is under the appeal of those famous musicians that developed economies agree to slash the debt owned by those African countries.

Regardless of the truth that there is a dark side hidden behind many stars, I would say that those celebrities, with their unique charisma, do have their role to play in arousing people's awareness of charity.

公众号：雅思情报圈

双边类 电影是为了娱乐大众还是具有教育意义

Some people believe that the only purpose of films is to entertain, others says that films also have educational value. Discuss both view and give your opinion.

范文:

Admittedly, it is reasonable that the entertainment to the public is considered as the only function of movies to some people, while I would argue that the educational influences are also manifest among films apart from the amusement essence themselves.

Rationalities may be witnessed when people only approve of the amusing core in their experiences of watching films. From their perspective, relaxations gained from indulging in the fantastic scenarios, the moving background music, the twisting story lines are the only reason for them to spend time having fun in this activity. As for them, there are abundant ways to gain knowledge, to establish deep thoughts, or to sense the bitterness of lives from their daily life from what they are injected or from the surroundings, which are therefore not what they want to get from the approximate 2 hrs spent in cinemas or in front of screens. They would much more like acquiring funs, internal happiness or even the true escapism off the real life--and those are the truth of entertainment--from this just action, even if they find that time may be squandered if they cannot make any concrete benefit from this, since the happy mood matters at this moment. At the meantime, it is also the sole reason why this industry prospers. Film makers, or should I say, all the personnel involving in this entertainment industries, are all earning their profits from what they provide to their audience, and that is the relaxations, delights, and other things from which people can get entertained during the time they are accompanied by this type of products. Different from other industries with truly utilitarian properties, the only way to make a film influential and to make the entire area boom is to let their public get fun and be willing to be amused in the fancies they build up.

Whereas those harboring these myopic conceptions may lose their votes when we look at the functions and characteristics of films from a macro perspective, and the educational influences would be much more outstanding to films' receivers. This medium, granted, is winning their likers by accumulating entertaining elements, but we can never deny that as a cultural resource, it is also imparting concepts, values and view of points that make us deeply look at the world differently. Ample instances have shown that apart from bringing happiness, films also generate tears, ponderances, or even sorrow to the audiences, to whom the aftertaste, or the introspection of the film per se is what should be worthier, and that is the educational values shining underlying every clip and montage. What is more, a throng of novelties and freshness are also the ultimate attractions in every film appealing to its audience, and that can also bring about information to those who otherwise will not know about those subtleties anyway. Magnificent technologies can be learned from the sci-fi, and the beauty nature of the wild would become the topic of conversations after

watching scenery movies; even the dressing code, sometimes are bridging the film fans all over the world.

In conclusion, it is easily fetched that movies are only an entertaining instrument for some, but the scope to this cultural medium should be observed more deeply, in order to explore its more influential price.

观点类 传统游戏 VS 现代游戏

Some people say modern children's games do not develop a wide range of skills, while traditional games can be much better for developing such skills. To what extent do you agree or disagree?

范文:

Modern games, especially video games, are taking over traditional games as children's major leisure activities. Some people think they are of less value when it comes to foster skills. I disagree with this view as both types of activities have their distinct advantages.

It is undeniable that traditional games are more conducive to developing exercising skills. Many games passed down through generations are involved in physical activities. For example, tag and chase can foster children's running skills, while jump rope can improve flexibility and physical coordination. In addition, traditional games often provide abundant opportunities to communicate face to face, helping to hone social skills. By contrast, modern games are often played by children at home where they are more likely to have interaction with machines, so they are less productive in improving interpersonal skills.

However, I believe modern games also have their advantages over traditional ones. Firstly, a certain proportion of modern games need teamwork and players can develop group work skills as they sometimes have to be united to overcome some challenge. In addition, many complicated online games involve tactics and strategies, which allows children to develop abilities such as quick thinking to act satisfactorily in the face of problems presented to them. Finally, traditional games cannot be compared to their electronic equivalents in terms of keeping up with the times by being exposed to state-of-the-art technologies.

To conclude, it is unjustified to say that traditional games are more valuable than modern ones as both can help children acquire useful skills in life.

公众号：雅思情报圈

观点类 可以用电脑看文物是否还需要博物馆

Nowadays, some people claim that public museums and art galleries will not be needed because people can see historical objects and works of art by using a computer. To what extent do you agree or disagree?

范文:

While there is a prevailing assertion that museums and galleries have no justification in the world where historical and art works can be displayed online, I tend to say that it is too simplistic an opinion to label the role of these institutions as a window for display.

Superficially, it might seem sensible that these traditional facilities are reckoned to have no reason to exist in this world dominated by computers. From the perspective of the advocates of this, the only reason for people to visit museums and galleries is to see their collections. In this sense, it makes little difference whether to browse the same items on the screen or in the exhibition hall; particularly given the availability of the AR(artificial reality) technology, which narrows the gap between virtual replicas and real-world experience.

Plausible though the argument seems, what is neglected by those who clamor for the obsolescence of these infrastructures is that the major function of museums and galleries is far from display. Instead, it is only one of the multiple characteristics of culture and art centers today - modern museums and galleries have evolved from simple exhibition space to multi-purpose complex that incorporate various roles, whether these be stages for avant-garde performances, a place for socializing for people sharing common interests, even the building itself is a work of art with both architectural and historical value. One convincing example is MOMA (The Museum Of Modern Art), whose role is not confined to a space to exhibit works of art, but more a venue for numerous performances from improvisation music to experimental drama. How can we translate the exquisite effects of instruments and light which are exclusive to live atmosphere through a computer screen and speakers?

In conclusion, I would say it is simple-minded to equate museums or galleries with a show room, and therefore claim to replace them with computer and the Internet.

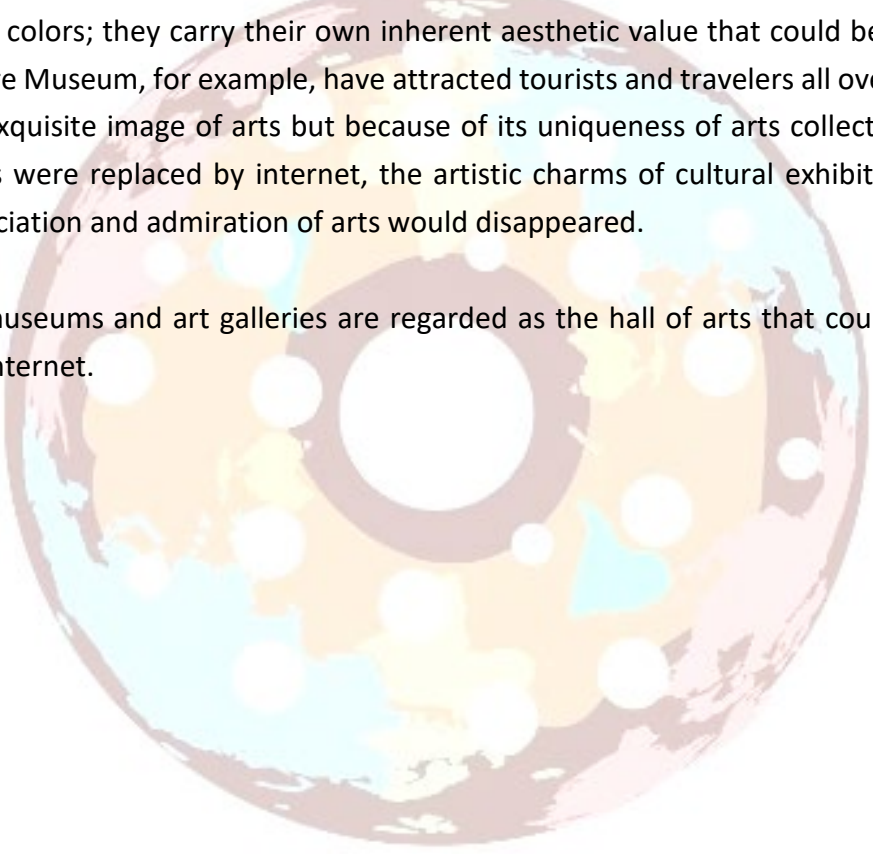

范文 2:

Popularity of internet has transformed modern lifestyle in many ways, including arts appreciation. There is a prediction that internet will substitute public museum and art galleries to show historical objects and works of art. Although internet users can easily browse some information of arts, museums and art galleries have interior values that could not be replaced by others.

Granted, numerous pictures of ancient or royal paintings and other arts can be available for those in remote areas and with inconvenience after a long-distance journey. However, the function of online surfing is efficiency and accuracy of retrieving information, not appreciation and collection of real arts themselves. Even detailed introduction on arts and high resolution(HR) image of relics could hardly distinguish the genuine from the fake, not to mention exhibition of face-to-face artistic charms.

Although online surfing means that information of arts could be downloaded free of charge and the pictures of arts could be copied for infinite times, artistic relics means much more than showing appearance and colors; they carry their own inherent aesthetic value that could be replaced by no other. The Louvre Museum, for example, have attracted tourists and travelers all over the world, not because of its exquisite image of arts but because of its uniqueness of arts collection. If museums and art galleries were replaced by internet, the artistic charms of cultural exhibitions would fade away and appreciation and admiration of arts would disappeared.

In conclusion, museums and art galleries are regarded as the hall of arts that could not be simply substituted by internet.

公众号：雅思情报圈

报告类 博物馆吸引游客而不是本地人

Many museums and historical sites are mainly visited by tourists, not local people. Why is this the case and what can be done to attract local people?

范文:

Different individual attitudes towards the experience of cultural industry and the inner property of museums make those historical sites only attract tourists but not local visitors. I would illustrate solutions in this essay to relieve this condition.

The first reason may lie on the attitudes held differently between tourists and local residents. Museums, especially those internationally famous ones, are invariably endured with the function of delivering cultural identity of a certain place: the architecture of the museums or heritage sites usually reflect the local style or civilized characteristic; the exhibits or relics are shown to manifest the history or humanity of the location. Therefore, these places are considered as a necessary scenery to newcomers, who would like to deeply enrich their touring experiences with novelties in an unfamiliar place. This, however, seldom panders the local residents who want to entertain themselves with some cultural products in their daily life with recreations that are more relaxed; a place that is seriously educative never fits with their preferences.

Besides, the development of today's museums also forces themselves to be far from the capacity attracting the locals. Those sites have already been shaped as the "transmitting instruments" of local cultures; they are considered as a part of the tourist industry oriented to the passers, or made to become the landmark of a tourist destination. Those scenic spots, ergo, inevitably share the characters of every other attractions: full of regional features, too typical and serious to be visited for more than once—once it is enough impressive to visit a place, there is no need for frequently experiencing by people already knowing this, and that is why dwellers are awe of visiting those museums; they are too monotonous and outworn for familiars.

That means the alternation is integral if museums want to extend their market among the local clients. A primary concept is to refine the stereotype of museums and heritage industries among their potential visitors; they should be with attractiveness to residents by abandoning the dull, serious image they used to have. Mass media can be the best channel in reshaping the role of museums: by making stunning films, documentaries or even online programs concerning to the exhibits or those valuable relics, people can be conveyed with the perception that one can also have fun with museums. Hard-advertisement is also highly welcomed: celebrities, or other public figures are also recommended to be invited to stand for heritage industries, or to come to museums in person.

Contents inside museums should also be bettered simultaneously, to make sure they can be largely fresh to the locals. New exhibiting forms, or technics should be employed to improve the involvement: computing technology like VR, for example, can be introduced in making the young experiencers less prone to come and visit. Changing the exhibitions is also imperative—it is granted hard to replace all the items or displays, but at least it is worth a trial to make place for some new shows—to increase the satisfaction of local travelers, or to earn reputation from their customers for a sustainable prosperity.

In conclusion, it is the misconception derived from residents and the narrowed function of museums that preclude the heritage industry from being prevailing among locals, and rooted transforms should be implemented in both the mentality of the dwellers and museums.

范文 2:

Museums and archeological sites are pillars of culture and learning where people can explore different tradition, new ideas and unique art forms. Unfortunately, it is observed that those places are more appealing to tourists and are missing out on local visitors. As this stands, causes behind this will be analyzed and possible strategies will be suggested accordingly in this essay.

The engagement between tourists and historic sites is a checklist in its nature. Most tourists who visit an archaeological site could be regarded as checklists. They base the success of their trip on the number of well-known sites they have seen to achieve a sense of accomplishment. Or for some, who attend a broader array of sites and attractions without going in depth, simply yearn to gain social status by being able to brag about all the famous places they have been to. However, for locals, this motivation seems to fail to apply. On the other hand, the barriers preventing people from attending museums and historic sites are lack of time and accessibility. The unconventional opening hours and long traveling distance are often mentioned as the factors that block local people, who unlike travellers, are usually fully occupied by they work, away from this heritage sites, which normally open only during the day. And during leisure hours, those city dwellers prefer opportunities to be entertained or socialize with friends in surroundings that bring the feeling of being at ease, while museums and historic sites are seen as boring, pointless and pretentious.

Encouragingly, there are a number of current initiatives that seek to connect local people to culture heritage. In order to attract more local visitors, it is suggested to create a relaxing atmosphere in museums and better with facilities to allow interaction. These could include things like workshops and other activities that combine learning with doing. Extended evening hours, more events like wine tasting or lectures to draw the community in, make connections in the community, familiarize local people with upcoming exhibits and events. Another tactic is recreating magic and joyful or

even engaging and exciting experience to retain repeat visitors through digital devices such as high-resolution images, 3D models, live streaming and immersive application.

In conclusion, it is an undesired and regrettable prospect if heritage sites are keeping losing its popularity among locals. Therefore, approaches that can boost their attractiveness and bring the local community and people back to their doors need to be recognized and carried out.

观点类 博物馆是否免费

The disadvantages of free admission to museum outweigh its advantages. Do you agree or disagree?

范文：

It is assumed that there are more drawbacks than benefits for museums to offer free admission to the public; however, I will disagree with this claim due to its lack of logical premises.

There seems to be reasons as to why problems with free admission policy are echoed by some people. For those who think in this way, the overriding conundrum that afflicts many museums today appears to be the financial plight, whether it be real estate prices, employees' salaries, or maintenance costs. Without incomes from ticket sales, many museums would inevitably end up closing due to the lost revenue. Some might argue that their public counterparts can survive with governmental subsidies; unfortunately, this shifts the financial burden onto the authority, which exacerbates the already frayed state fund. All these concomitants are venerated by critics as opposed to the higher attendance thanks to the free admission.

Plausible though the above reasoning seems, I believe it is simplistic to deem free admission to museums negative while ignoring contexts. Those critics are oblivious to the fact that the implications of any public service should domain specific and context dependent. Based on this, the discussion can then move on to handle questions as to which social impacts are more desirable in the local context and what local stakeholders value more. Take affluent countries for example, where the public literate level and culture milieu are placed higher position over operation costs of museums, the free admission policy can be viewed from a positive perspective in terms of its underlying relevance to the improved literacy among the populace.

From what has been discussed above, whether free admission to museums is a blessing or a curse should be subject to social contexts.

观点类 电脑科技正取代图书馆的一些功能

Maintaining public libraries is a waste of money since computer technology is now replacing their functions. To what extent do you agree or disagree?

范文:

The operation of libraries requires substantial investment and many people today tend to read materials online rather than in libraries. Despite this change, I believe that it is worth maintaining public libraries.

Public libraries provide a comfortable place where readers can enjoy reading. Visitors are not allowed to talk loudly or speak on the phone in libraries, and with this quiet atmosphere, they can escape the noise and stress of urban life. They can focus on reading and gain knowledge by maintaining this healthy hobby. In contrast, there are more distractions, such as video games and noisy neighbours, if they choose to read online at home.

Public libraries also play an important part in imparting knowledge to the public and improving the literacy of the general population. Libraries are likely to organise some activities to bring people together, especially those who have common interests. In this way, reading will become a norm in cities, and children who grow up in this culture can develop a positive attitude to this habit from a young age. This can increase employment possibilities and also make them polite and well-mannered individuals.

On the other hand, libraries may become less important in the digital age because people are able to collect information online from the comfort of their homes. This is particularly important for those who cannot visit libraries frequently because of their heavy workload. For this reason, governments can cut funds for public libraries and divert money to other projects such as improving broadband services for more users.

In conclusion, public libraries have an important place in communities even if digital libraries have met the needs of many users for knowledge in the modern world.

双边类 每个城镇建造图书馆

Some people think the government should pay for public libraries in every town, while others think it is a waste of money, as we can access to information from the Internet. Discuss both views and give your opinion.

范文：

There is an opinion that the authority should subsidize the costs of all public libraries, whereas some people consider it a waste of state funds. From my perspective, neither of the two views is justified enough to represent the entire picture if not contextualized.

On the one hand, the problem with those taking government subsidy to libraries for granted resides in their lack of scrutiny of the local context of individual city. The residents of each town may attribute the cost of public library to municipal budget, which mainly comes from tax income; however, I have to say the logic is not applicable to all cities – those championing state funds are oblivious to the difference of financial status between different regions; there do exist many impoverished areas where the local authority cannot afford the overheads of a library. In response to this, alternative financial sources may be needed, whether these be sponsorship from companies or income from library membership.

By the same token, it is also generalized to label the government expenditure on public libraries as a complete waste of money. Rather than something generally accepted, the descriptor 'waste' is subject to viewpoints from which individuals define the rewards. Based on this understanding, the discussion can then move on to questions as to which social implications are more desirable in the local context or what local stakeholders value more. For a town which gives its priority to hunger and poverty, any dollars spent on a library may evoke resentment from the populace; rather, in development regions where public literacy is venerated over material needs, it makes sense for public libraries to deserve a place in state budget.

From what has been discussed above, it is my conclusion therefore, the justification of government subsidy to public libraries is a question to which the answer is context dependent, and therefore it is simplistic to label it either necessary or unfair.

双边类 天才才能搞艺术？

Some people think that men and women have different qualities. Therefore, some certain jobs are suitable for men and some jobs are suitable for women. To what extent do you agree or disagree?

范文：

Who is qualified to engage in creating artworks has long been a controversy for decades: while it is traditionally believed to be an domain inhabited by divinities with artistic genes, modernists are clamoring for the opinion that everybody is entitled to the job. Unfortunately, I have to say that neither of the two assumptions makes sense to me, when we fail to set an authoritative definition of the so-called artworks, nor can we find ways to judge certain talent to be nature or nurture.

Those who embrace the concept that art is a realm exclusive to inborn talents are oblivious to the unpracticality as to how to predict whether a baby is born with the potential to be an artist. In a more everyday language, I can hardly imagine any scientific methods or objective standard being employed to judge how much a masterpiece of painting or sculpture can be attribute to innate specialty. Contrary to what it may seem, this rhetoric of inherent quality is more like an individual presupposition rather than an unadulterated source of truth. Looking back all those famous painters or sculptors in history, I don't think it is persuasive to credit them with natural talents while ignoring other determinants such as professional training or other extrinsic motivation factors that stimulated their creativity.

Likewise, the opinion to equate art with a free zone for anybody also seems absurd to me. Indeed, such a delusion has crept into the thinking of many modernists nowadays, much to the delight of those self-proclaimed devotees of Dadaism, who send a toilet or bicycle wheels to galleries and therefore won themselves the name of artist. Nevertheless, that begs another question – what kind of thing can be defined as artworks according to their perception? It is also an ambiguous term same as the talent mentioned above; its interpretation from their perspective hinges much on subjective supposition – one painting might be fascinating and attractive to some colonies but totally repulsive to traditional critics.

From what has been discussed, it looks to me that neither of the two views in the prompt has its justification if we fail to set up an authoritative criterion on how to define the confines of artworks or the differences between inherent aptitude and acquired techniques.

观点类 艺术无法提高生活质量

Some people think that art (such as painting and music) does not directly improve quality of people's life, so government should spend money on other areas. To what extent do you agree or disagree?

范文:

In spite of the fact that the world is undergoing various changes in recent years, the art remains one of the most heatedly discussed issues, especially the one related to whether it deserves governments' compensation or not. There exist some people who argue that financial resources should not be devoted to art but to more pressing issues. Personally, I believe that art is a project that definitely requires enormous governmental support.

First of all, art can be considered as the national treasure that was transmitted from generation to generation. To put it another way, art is the cultural legacy bestowed by our ancestors, and therefore a great way of informing our offspring of our splendid history. Accordingly, providing financial support to artists can be seen as an investment in culture which is both essential and profitable.

Apart from the historical value of art, another reason of spending on art might be its obvious recreational value. To be more specific, by watching art works, people could actually get relaxed and entertained since art is always regarded as a wonderful way of entertainment. In this way, pressure from work or study might be alleviated, which may contribute to the enhancement of work or study efficiency.

Admittedly, projects such as medical care also need governmental support. As a matter of fact, with more financial subsidies devoted to medical care, the physical as well as psychological well-being of citizens may be guaranteed, thus the life expectancy of our people could further be increased.

To summarize, despite that projects concerning people's livelihood require financial support from the government, I am still convinced of the necessity of supporting art mainly because of its historical as well as recreational value.

混合类 什么是艺术可以告诉我们而科技不能

In today's world of advanced science and technology, we still greatly value our artists such as musicians, painters and writers. What can arts tell us about life that science and technology cannot?

范文:

For some people, art appears very impractical, especially in comparison with science and technology. Regardless of its exact form, however, art serves as vital nourishment to the human spirit, using it to explore our world and the truths that more practical endeavors can sometimes obscure.

Throughout history, art serves as a record of those times and contributes greatly to the study of the human past. By examine paintings, words, music sculpture and other handmade object, people can gain much insight into the technology and economics of early peoples as well as the political and social structure of past cultures. Those art works can also reveal a great deal about certain aspects of the religious and ideology of ancient societies.

On the other hand, works created by artists may inspire the observers to have a more positive and joyous attitude towards the world around him. A beautiful painting or song or verse and prose creates a sense of happiness in the viewers, filling their soul with wonder and contentment. Besides, as is fueled by imagination, art acts to illuminate the wondrous variety of human beings, and make them to look at the world in ways they may not have otherwise considered. A portrait of a beloved historic figure may show him in an ugly or less than flattering light, forcing the viewer to reconsider her preconceived notions. When this feature of art is made the most of, artists can act as social revolutionaries, as those history's most dynamic artists who are often catalyst for controversy are capable of highlighting injustices and inciting the viewers to change the way things are.

In conclusion, despite those exhilaration brought up by science and technology, art is inseparably linked with the wellbeing of human beings and progression of civilization.

观点类 研究过去还是现在

Some people think it is a waste of time and money researching the past, and that we should research the issues that affect the world today instead. To what extent do you agree or disagree?

范文:

There is an opinion that it is a waste to study the past and the money and time should be spent on researching current issues today. I disagree with the statement as I do not think it is an either-or problem to which we can jump to a conclusion without appraising all possible premises.

It is groundless to label it a vain investment to research things happened before: whether a project is valuable is an issue of great complexity that may differ by the standpoints of individuals and requires rigorous scrutiny of all possible determinants, such as the goals of the researchers and the potential benefits brought by the study. For example, the study of social structure in ancient China might seem meaningless to a smartphone manufacture, but the result would be invaluable to historians and sociologists, whose profession is to explore the evidence of the evolution of human civilization. In this sense, the value of such projects cannot be over emphasized.

Similarly, I would also say it is simple-minded to prioritize the importance of the research of modern problems over historical study. Those who think in this way are oblivious to the fact that many problems we face today are the symptom of problems to which we should look back on our history and former experience for answers. One compelling example is the prevailing problem of terrorism today, an issue whose origin is usually inextricably bound up with a chain of political or economic events alongside the timeline of history. In this respect, instead of focusing on the analysis of current phenomenon, it is the analysis of its underlying relevance to various factors in history that is of paramount importance for us to find solutions to open the deadlock.

In conclusion, I do not think it rational to prioritize the value of modern research over historical study recklessly.

公众号：雅思情报圈

双边类 研究历史对现代生活有用吗？

Some people believe that studying the past can teach nothing about life today. Others believe that history is a valuable source of information for life today. Discuss both views and give your opinion.

范文：

It may be understandable for some to consider it meaningless to study history, while I believe that history is important, as by understanding the past, which in turn allows us to understand our present.

For those who tend to be more doubtful about the need to know the past, more attention is paid to the present and anticipation of what is yet to come. In a modern society, which has changed beyond our wildest expectations due to technological and scientific breakthroughs, the function of history seemingly fails to serve a practical purpose when compared with those of engineering or medicine. However, history is in fact very useful, actually indispensable, but the products of historical study are less tangible, sometimes less immediate than those that stem from other fields.

The past causes the present, and the future as well. Every time we try to understand why something happened, we may well look for factors that took shape earlier. Sometimes fairly recent history will suffice to explain a major development, but often we need to look further back to identify the causes specifically and detailedly. Besides, history offers a storehouse of information about how people and societies behave. An exclusive reliance on current data would needlessly handicap our efforts. For example, we cannot evaluate war in a peaceful age, unless we use historical materials. Or when some social scientists attempt to formulate laws or theories about human behavior, data and other recourses deriving from the past are surely of high value.

All of these, fundamentally, is why we cannot stay away from history. It offers extensive evidential base for the analysis and contemplation of the current world as well as reasonable predictions of what will happen next.

公众号：雅思情报圈

观点类 学习世界历史还是当地历史？

It is more important for school children to learn about their local history than the world history. To what extent do you agree or disagree?

范文：

Though there exist varieties of tradition and culture, which differ from region to region and each region has history of its own, when combined, they form the unity or in the spirit of oneness which is known as world history. Therefore, the study of local history and world history is equally important, as they are inseparable and inevitably interdependent.

There exists an unbroken chain by which local history is indissolubly linked with the world history. It is vitally important to study the big picture of history such as the rise and fall of civilization, the progress of major social and economic changes and other events that affects whole countries, peoples and the world at large. Although it is worthwhile to remember all these major processes and events, we should also bear in mind that individuals, locales and communities all played their part in shaping and being shaped by the world history. Local history can be seen as representation of the grand scheme of historical changes on a small scale as it contains a wealth of details and stories that reveal how social changes impacted the lives of ordinary people which in turn make up the large pattern.

Especially, under the context of globalization, the process of history is in effect about the processes of encounters, connections, integrations and assimilations. For centuries, local cultures and traditions have been invariably involved diverse adaptations and assimilations to foreign conquests, religious conversions, new technologies, strangers from afar and commodities imported from beyond the boundaries of local societies. Many aspects including state constitutional forms and social bases along with policy responses to challenges and opportunities are usually the products of analyses of interactions between the local and the global.

In short, local history and world history, despite their diversities, run a strong invisible under-current of unity that nourishes and sustains the other. Therefore, theory for the comprehension of humanity's long-run history is to place equal value to both of these two.

观点类 政府是否支持文化

Some people think the government funding should not be used for supporting art and culture, others think supporting cultural activities may be beneficial for the population and the culture. Discuss both views and give your own opinion.

范文:

People have divergent opinions as to whether the government should financially support the art and culture. Some people think it could bring benefits to the society while others believe not. Personally, governments should allocate money on culture and art if their economic conditions allow.

It is reasonable to assume that investing art and culture may have some drawbacks, especially for those unprivileged countries. It is true that art cannot enhance people's living standard directly. If an underdeveloped country allocating large proportion of budget on art while neglecting people's basic needs, its citizens may find it hard to live a decent life. For example, they may lack the ability to provide access to medical care and education. Hence, disadvantaged residents may unable to enjoy long expectancy and could not find satisfying occupations to support themselves.

However, investing funds in art and culture also has its advantages both for individuals and the society. Firstly, arts provide people with entertainment and yield various psychological rewards, such as relief from stress. As a matter of fact, people's well-being is not only about the material contentment but also the spiritual satisfaction. More attention to art and culture can meet people's spiritual needs, enrich their cultural life. Then, as for the society, prosperous culture is also a sign of a civilized city. A culturally rich environment would attract more tourists, which will bring huge profits to local residents as they can boost tourism and create more job opportunities.

As far as I am concerned, despite some potential drawbacks for underdeveloped countries' allocating subsidy on art and culture, it has more benefits in investing them provided they are economically allowed.

观点类 多元文化社会给国家带来更多优势

Multicultural societies, where people of different ethnic groups live together, can bring more benefits than drawbacks to a country. To what extent do you agree or disagree?

范文:

In the era of globalization, multicultural societies are common in most developed countries. As a consequence, new challenges at both national and international levels have become apparent, and successful adaptation to this new phenomenon of migration appears as a fundamental issue. Therefore, there are some people who argue that this tendency would bring more merits rather than demerits to the society. Personally, I partially agree with this idea.

First of all, multicultural society promotes the innovation of the whole society to a certain extent. This is because people from different countries speaking different mother tongues which represents diverse ways of thinking patterns. In other words, the existence of a pluralistic society represents the diversity of thinking modes in that society. When people communicate with people with different thinking modes, it will eventually be conducive to the cultivation of their divergent thinking, thus promoting the innovation of the whole society.

Besides, multicultural society is conducive to the integration of different cultures. In the past, due to geographical isolation and other factors, people from different countries did not understand each other enough, and even because of the limited information or even blockade, citizens from various ethnic groups may misunderstand or discriminate against other countries. However, with the development of Internet and global transportation, people now live together regardless their nationalities and communicate with each other to exchange what they have, which is beneficial to enhance the understanding between people of all countries. For example, European people's understanding of China used to largely come from movies, and misunderstood China as a deprived and backward country. As more and more Europeans come to live or work in China, but now a growing number of people recognize and appreciate Chinese culture, which facilitates cultural exchanges between China and foreign countries.

Admittedly, the existence of a multicultural society does bring about some problems. One of the most obvious is that for people with weak national identity, they are very easy to be eroded by other countries' cultures, and eventually lead to cultural assimilation. However, at present, governments of all countries attach great importance to the protection and publicity of their own culture, and strengthen the education of history and language since childhood. I believe that to a certain extent, this can improve the cultural identity of their citizens.

In conclusion, despite the drawbacks that multiculturalism may bring about, it seems to me that this would exert beneficial impacts on the countries globally.

公众号：雅思情报圈

双边类 商业和文化交流有益还是削弱民族认同感？

Some people think the increasing business and cultural contact between countries brings many positive effects. Others say it causes the loss of national identities. Discuss on both sides and give your opinion.

范文：

While some people render global cultural and trade communications positive, others believe that these activities should be culpable for the loss of national identity. I would say both views can be deemed justified, depending on the discrete condition of individual countries.

From the 'positive' perspective, it makes sense that developed countries do benefit from booming international exchange in terms of culture and business. Thanks to the mass production brought by industrialization, industrialized countries can export their products to the rest of the world with relatively lower costs, whether these be basic commodities or electronic gadgets. In this respect, not only do these countries increase revenue from product sales, but also spread their lifestyles and cultures bound up with their goods. One convincing example can be seen in the prevalence of American fast food culture and jazz music, which is the result of ubiquitous stores of Starbucks and music packs pre-installed in iPhones.

On the other hand, and from the 'negative' perspective, such a trend is recognized as the main culprit that undermines national identity of developing countries. The benefits mentioned above can be considered from an opposite angle: the relentless intrusion of international brands is ousting their indigenous equivalents from daily lives of local residents, which inevitably leads to the fading of tradition and culture of a country – let's not be oblivious to the fact that a nation's customs, lifestyles or ethos are inextricably bound up with its artefacts. One disturbing example is the demise of tea culture among younger generations in China due to their preference for coffee.

It is my conclusion therefore, the increasing business and cultural communication across the world can be deemed both positive and negative, depending on the socioeconomic status of different countries.

观点类 人们穿西式衣服多过传统衣服是好是坏？

In many countries, people wear more western-style clothes (suits and jeans) than their traditional clothes. Why? Is it a positive or negative development?

范文：

Western clothing styles have widely conquered the hearts and closets of people all over the world, especially suits and jeans which have found their place in the wardrobes of rich and poor, celebrities and common people. There are several reasons behind this pervasive dressing style.

Clothing styles change over time for a variety of reasons. Although environmental changes can have drastic effects, trade causes the quickest shifts in a culture's clothing styles. The prevalence of western styles throughout the world indicates the global dominance of western trade. Meanwhile, cultural currents flowing through Europe also facilitate the spread of this clothing style. Colonies with western settlers followed fashion trends back home and picked up the attire that way. Other countries, such as Japan, China and Russia, willingly adopted the dressing style as a part of their modernization efforts. They wished to catch up with and compete with the West and they believed that this required them to abandon many of their old traditions in favor of the new industries and styles that made the West successful. And the shift from traditional wear to western attire bears practical and conceptual reasons as well. For example, jeans are thick, strong and long lasting. They require little maintenance and anybody will swear for its durability. Suits are prone to be taken as a symbol of elite.

On the other hand, this seemingly inevitable trend exerts negative impact on local culture. Since western style clothes flourished in many countries, the traditional apparel industry has been radically weakened. As textile manufacturing became more efficient and increasingly cheaper to purchase the mass-produced jeans and suits rather than spend large amount of time and resources sewing or embroidering, the traditional crafts and skills are gradually vanishing. It is not uncommon that the traditional costumes have almost disappeared or are on the way to disappear under this pressure.

In conclusion, the domination of western culture and the practicality of the clothing itself make it an inevitable trend that prevails many countries. However, the loss of culture identity is indeed a cause of regret.

双边类 政府是否要出钱拯救小语言

Some people say that the government should spend money on measures to save languages that are used by few speakers, while others believe that it is a waste of financial resources. Discuss both views and give your opinion.

范文:

It may be understandable for those considering the meaninglessness of the protection for the minority languages, while I would believe that solutions and monetary flows in the governmental preservation of those linguistic data cannot be deemed “a waste”.

For those who think the waste of the resources and energy injected into saving those languages spoken by a limited ethnic groups, they may hold the consideration that money, researchers and schemes utilized may be to no avail. To those in the utilitarian society, anything that has no immediate benefit may be categorized as “waste”. There are so many urgent things awaiting financial allocations, and the manpower, the time spent on collecting data of these linguistic researches, most of which may also be in vain, since they, at most of times, prove no results at all, would definitely not be approved of money squandered. Sadly, however, it is true that the salvage for those losses cannot always become a satisfactory goal, since the languages with the faith of extinction should never be given a new life but survive without being dismissed.

The myopic thinking exhibited in the aforementioned paragraph, which is also argued by an overwhelming people, is the rankest psychology of all. That is also the state of mind precluding the most from looking at the world from a macro perspective. The potential wealth lying behind those linguistic researches with the property of seeming uselessness, is that they may interpret prior knowledge and premises in the historical times to a particular community. Most of this information reflects how those ancestors struggled with their lives against the hardships and fierce surroundings, and how they can sincerely adhere to their final humanities. The experiences of this undoubtedly have reinforced the foundation of the future development of the whole society, and those languages deserve our officials and authorities to pour their passions and financial resources to build up the researching system and to foster a huge quantity of expertise and professionals striking for this.

In conclusion, dichotomization may be essential when analyzing the topic of this, and the value of spending money saving those linguistic data with fate of extinction cannot be solely considered unworthy in a restricted way.

范文 2:

Those minority languages are dying out due to the decreasing number of speakers. Some linguists suggest saving the extinct languages with the national fundings, while others believe that it is not worthwhile to preserve the unpopular languages.

The preservers convince the authorities of cultural significance. As it is universal, a language intertwists a unique culture, along with the ancient knowledge and traditional wisdoms hidden behind. Languages preservation and revision is kind of protection to the culture heritage and cultural diversity in the nations and worldwide, making more contributions to the multi-cultural society.

However, to fund the languages with few users is of low cost-effective in the national level. The origin of a certain kind of language was derived from a mean of communication within particular tribes. Once popularized among a descending number of people, the language correspondingly loses its intermedia and basic functions, meaning that it is dying out sooner or later. There is nothing more government can do to stop the inevitable trend, but to invest a large amount financial resources and human resources in encouraging the popularity of some uncommon languages, which is rarely productive and time-consuming. Such an unwise investment will increase the opportunity cost, which could have provided to other priorities, such as health care and education.

It is of futile effect to stop the destined extinction of some unpopular language. Instead, governments should wisely fund on other priorities, like livelihood issues. Life will be easier when there are less languages in the world.

Cycling is more environmentally friendly than other forms of transport. Why is it not popular in many places? And how to increase its popularity?

范文:

In spite of the fact that riding bicycles is more environmentally-friendly than any other vehicles, the two-wheeled mode of transport's popularity began to disappear and are gradually replaced by their fuel-powered competitors. It seems to me that the manpower operating system and uncomfortable riding experience are the two main reasons for this unpopularity, with some suggestions proposed to cope with this predicament.

First of all, the efficiency of cycling is much lower compared with other fuel or electricity powered vehicles. In other words, bikes are operated by human beings themselves, by which I mean cycling is more physically demanding but the speed of this is not satisfactory. Therefore, for the city commuters, especially those who are living in the metropolitan ones and have to travel long distance to work on the daily basis, cycling can hardly be seen a priority means compared with other transportation methods. Apart from the low efficiency, the poor riding experience also cannot be ignored. In most countries of the world, the weather is not that stabilized all year round. Except the extreme weather such as storm or torrential rain, the daily temperature also bring people challenges while riding, especially during winter and summer.

There are several suggestions to alleviate the situation. First, the introduction of bike-sharing does contribute to the rescue of cycling, which effectively solves the 'last mile' problem. For example, In China, people can simply use their smart mobiles to unlock the bike, utilizing them during the last part of their destination where it is unreachable by the public systems and originally has to be arrived by walking. Second, cycling activities can also be organized as a kind of routine. Although technological advances bring about enormous conveniences to people's daily life, the lack of exercise is also emerged. Cycling is such a valuable method, which can reduce the risk of diseases such as diabetes, heart disease and several cancers. However, facing the daily mounting pressure, few people would prefer to exercise but rather stay at home. Thus, organizing the cycling activities by the government or certain associations can enhance the popularity of riding bikes and meanwhile enhance the overall health conditions of citizens.

In conclusion, the application of bike-sharing and the prevalence of cycling activities are the two solutions that I came up with.

混合类 有些人喜欢开车，另一些喜欢骑自行车

People in some cities prefer driving cars to biking, while in some other cities, people like to travel by bike. What are the reasons for these developments and which one do you think is better?

范文:

People in some cities opt for a private vehicle to a particular place. However, individuals in some other cities prefer to travel in a greener way. The reasons behind this phenomenon are multiple, and I believe that biking is preferable in the long run.

There are two main reasons for this development. First of all, most cities are faced with serious traffic congestion. Driving at rush hour, especially in busy metropolitan areas, can be very frustrating as drivers have to deal with stop and go traffic. By contrast, biking paths and sidewalks have much less congestion. Another reason is that the public are more concerned about their health. Biking enables travelers to not only burn calories and strengthen the muscles in legs, but also lower blood pressure and risk of cancer, diabetes, and other diseases over time.

It is undeniable that driving to and from places has its own benefits. It is generally a more comfortable and safer experience especially when traveling a long distance. However, there are quite a few benefits of choosing to ride a bike rather than driving when it comes to small-scale trips, like biking to class or work. It is a more effective way to reduce traffic and curb greenhouse gas emissions, which helps to improve the environment. Furthermore, cycling, as well as other forms of aerobic exercise, can make people healthier both physically and mentally.

In conclusion, traffic jam and health concerns are two main causes for people to choose to cycle instead of driving. I think riding bicycles will become increasingly popular among the public.

公众号：雅思情报圈

利弊类 私家车越来越多的利弊

More and more people buy and use their own car. Do you think advantages of this trend for individuals overweight the disadvantages for environment?

范文:

It has been a popular trend that a growing number of people tend to buy their own cars. While its benefits to individuals are beyond doubt, I would say that detrimental effects of the driving trend on environment are far outweighing.

From an individual perspective, the trend of life-on-wheels can be seen as positive for both comfortable and convenient reasons. Firstly, it is not difficult to imagine the comfort of driving to work in comparison with the feeling of being sandwiched in the packed subway during rush hours. Also, for some travelers who need to commute between cities frequently, driving by themselves is sometimes a relatively more affordable and convenient alternative to air flights, which is more expensive and irritating when considering the cumbersome security procedures at airports, if not the commonplace delay.

However, these superficial benefits mentioned above are not justified enough to offset its damage to the environment. Out of all the problems, the carbon dioxide commissions stand out as the most serious symptom of the problem to which I see the prevailing driving lifestyle as the answer. Another apprehension we cannot afford to ignore is potential exhaustion of fuel energy with the rising number of cars. Some might argue that both problems could be mitigated by the electronic car, which are reckoned as a cleaner and energy saving alternative to its traditional counterparts in the near future. Nevertheless, this might lead to a new problem: how to deal with the discarded old models? Given the fact that most of their materials and engines are non-biodegradable, they might stay in the junk yard for decades.

In conclusion, although the benefits of private cars cannot be denied, I would say these merits for individuals should be at the sacrifice of environment.

范文 2:

It is extremely hard to conceive of vigorous city growth without an efficient transport system. Although modern technology can somehow reduce the demand for physical transport by facilitating teleworking and network services, the requirement for transport continues to increase, and the spectacular growth in private car use is a perfect indicator of this trend.

The main point of the increasing number of private cars is that it provides people with the chance of making a better balance between their transport needs and their living comfortability. That is of vital importance when cities are expanding extremely rapidly. Residents are hard-wired to concentrate in urban centers as it is much convenient for them to reach their every daily destination (shopping malls, workplaces, etc.). But the huge attractiveness of the city center also gives rise to higher residential costs. As for the most middle-class, they might have to either spend a large amount of money renting or purchasing a rather shabby, small apartment in order to live around, or instead, pay for a better living condition in a rather faraway place (suburbs sometimes) at the cost of inconvenient transport. However, this problem, though not thoroughly resolved, can certainly be released to a large extent by people buying their own cars; by means of the mobility brought by private cars, people can at least drive their way to the locations they want without worrying too much about the traffic, and at the same time, choose a more comfortable place, larger, better equipped, and most importantly, more affordable, even though this place may be somehow distant from the downtown area.

The scenario above is just the bright side of the picture. The truth is that, no matter how efficient and convenient the cars have brought us, we cannot eliminate the drawbacks the former has produced on the environment. Carbon emission renders climate change, in which the use of cars plays an essential role. Even though hybrid or electric cars sound like an alternative, we shouldn't ignore the place where the electricity comes from; because of the limitation of modern technology, power stations are still using traditional resources-gasoline, coal, etc.-to provide the energy for most electric car users, and that is also polluting the air, water and other nature resources. There is, also, no scheme in place for us to better the efficiency of renewable energy resource transformation; our dream of the widespread use of solar or tidal power is still a dream over a short-term period. Worse yet, for the purpose of industrial development, car producers are continuously misguiding their customers by advertising how environmental the new energy vehicles are, and that leads to people increasing their car uses but being careless about the environmental responsibilities.

The problem, however, is that, even if we are clear about how cars facilitate our life and how they are blighting the environment, there is still not a definite answer about whether the trend is an optimistic one or not. For any comparison to happen, one should first have a system where most parameters are all set and quantifiable to make the final evaluation. But that doesn't apply to the one we encounter in this topic since neither the individual benefits nor the environmental damage is hard to quantify. We cannot determine the exact profits people gain from owning a car, nor do we know the specific costs of the environmental problems those cars have caused. It is then understandable that the result of this comparison is fuzzy, let alone that too many other factors (the development of public transport, for example) are also affecting the possibility of people choosing to live out of the town and the air pollution within a city. Therefore, it is not doable for us to conclude

whether this trend is positive or not, and even if there is a speculation in place, the value is still controversial.

公众号：雅思情报圈

利弊类 “无车日” 是好是坏

Vehicle-free day means the private cars, trucks and motorcycles are banned in city centers. Only Public transportations like buses, bicycles and taxis are permitted in the city center. Do you think the benefits outweigh the disadvantages?

范文:

Within some metropolises, citizens can only access to hustle and bustle of the cities by the public transports during the vehicle-free day. I believe that forbidding the private cars, even in some day, is not a wise suggestion to tackle the urban issue, since there are more drawbacks than advantages.

One positive change would be the conducive approach in reducing the traffic burden, as well as the air pollution in the urban. Due to less private vehicles on the road, the public transportation system can run more smoothly, and correspondingly the less exhausted emissions resulting to air pollution. However, there seems to be a temporary relief of the urban problems in just the scheduled days, rather than an effective cure to benefit the public.

Instead, the vehicle-free day discourage the dwellers' inclination to favour the public transportation system by lowering the amenity as well as the working efficiency. It can be conceived that, commuters frequently get stuck and squashed in the city transports, not to mention about the vehicle-free day when an extra flock of passengers rushing onto the buses. On the other hand, when private vehicles are prohibited in the centres, those with limited mobility like the disable have to waste ages for taxis to transfer them between the urban and the outskirt. Such an uncomfortable and inefficient experience with the public transportation system disappoints both the bus takers and private car drivers.

Although the intention of the vehicle-free day is to address the urban problems, yet I believe it is not a long-term measure, but adversely discredit the public transportation.

公众号：雅思情报圈

观点类 提高驾驶年龄是不是提高道路安全

Some people think the best way to improve road safety is to increase the minimum legal age for driving cars and motorcycles. To what extent do you agree or disagree?

范文:

I shall argue in this essay that there is no correlation between road safety problems and how old an adult is permitted to drive cars or motorbikes; irrationalities should be seen in the claim made by the topic.

The safety problems emerging in traffic is nothing correlated to how old an adult gets the driving license; mostly, whether the driving process is with or without security is mainly decided by the driving ability and focus of the drivers. For those who myopically link the two elements together, they may superficially recognize the phenomenon—indeed, there are young adults who just have been entitled to drive their cars causing a majority of traffic accidents. But the truth should be seen past: it is not the age that leads to those tragedies, but the lack of experience and instant reactions in dealing with complex transport situations. Those experienced drivers can feasibly manipulate their wheels to realize the smooth driving, or to avoid the potential hazards that are frequently coming along in their daily witnesses, but it is so hard for a “new-comer” to do exactly the same: they perform clumsily in making judgement of the traffic flows in front, and are always busy with getting close to every instrument -reflecting mirrors, the handbrake, etc.—necessarily used in their safe driving. That means, whenever get the licenses, individuals would always suffer from the period of being the potential risky elements on the road. The policy in the claim, ergo, is extremely unreasonable to be proposed as a proper policy.

Before scrutinizing what is the most proper way of dealing with the road security, one must examine the rooted reasons lying behind related facts. Better choices should be made on launching programs or developing policies adhering to the true causes of the emergence of those accidents—what really makes the disorders of traffic system, certainly, is not the age of those drivers, but factors concerning to the driving skills and subtleties emerging during the driving procedure. Therefore, regulations are more suggested in bettering the training part during the driving license tests to make sure that newly qualified drivers would be more skillful in dealing with complex traffic situations, or in severely banning any distractions during the driving hours: a longer real road driving practice could be involved in the probation of drivers, to make sure that they won't panic or mishandle the vehicles in some extreme circumstances; supervisions like cameras or cable televisions, are recommended on roads to keep watches on the drivers, to make sure they are not playing mobile phones during the driving. The aforementioned means, though with flaws, are definitely more effective than the action of absurdly increasing the age limit of drivers, since they are focusing more on the essence of the problem, but not the unrelated causes.

In conclusion, I would very much agree that increasing the minimum age permission of driving is not the way of dealing with the traffic safety since I too share the gift of foresight of seeing the essential cruxes of a problem.

观点类 提高道路安全的唯一办法是更严厉的惩罚？

Some people think that the only way to improve safety of our roads is to give much stricter punishments on driving offenses. To what extent do you agree or disagree?

范文：

It is irrefutable that careless driving and violation of traffic rules certainly result in a large number of accidents and stricter punishments are necessary to reduce them. However, I believe that there are also certain other measures that have equal or more effectiveness in ensuring road safety.

It is undeniable that stricter punishments can be somewhat effective to improve road safety. As we all know, motoring offence is crime. In this case, proposing tough policies about both non-custodial sentence and prison sentence is necessary because they can act as a deterrent. In fact, many countries in the world implemented the confiscation of the driving licenses to people not adhering to the traffic law. In the UK, for example, people can take a prison sentence for several years because of endangering innocent live. These policies absolutely succeed in a certain aspect. However, this does not mean that stricter punishment is the only way to tackle this problem. After all, there are certain accidents that occur not because of traffic violations but the poor road and climate conditions. Therefore, it should be noted that drivers alone cannot be blamed for such mishaps and other measures are also needed.

A more effective strategy by the government would be to straighten accident prone curves and widen narrow roads. Larger number of road signs and proper traffic signals can also be effective in reducing accidents on roads. Moreover, speed cameras can be installed to remind drivers not to commit any mistake or break the rules. Recently, the way is applied in many areas and already brings positive results as a decreasing of the number of people going beyond standard speed. Finally, the police should patrol regularly around roads of local by vehicle inspections, which makes sure that they can do something on time as a sudden accident.

In conclusion, there is not only way that brings stricter punishments to change road safety. we should flexibly use proper traffic measures on driving offenses to get the best results.

报告类 交通拥堵的问题

In most cities and towns, the high volumes of road traffic become a problem. What are the causes of that? And what actions can be taken to solve this problem?

范文:

We all have experienced traffic jams: public buses are crawling with minivans, cars and trucks; ear-splitting honk infuriates traffic police officers as they try to keep things moving; impetuous motorcyclists cram into seemingly impossible gaps, rendering gridlocks even worse. This kind of traffic situation is so annoying that a lot of traffic experts and city planners try to figure out the reasons behind it and solve this problem for good.

Mostly, traffic congestion happens in city centers when traffic demand exceeds the available road capacity or road supply. From the demand-side, over the last few decades, cars and other private vehicles spike across the world, which is the result of fast economic growth and improved living standards that come with it. On the other hand, from the supply side, road and expressway capacity in city centers can't be easily expanded due to limited land spaces there. Even if road expansion could be put in place, it won't alleviate bumper-to-bumper traffic in downtown areas because statistics show that increasing road capacity reduces the cost of travel and thus induces additional traffic demand that continues to rise until peak congestion returns to the previous level.

Therefore, adding more lanes or building more roads wouldn't be the savior for traffic jams. If this doesn't work, what can relevant authorities do? Maybe in the short run, they should consider ways to reduce cars on the road like imposing congestion taxes, charging higher parking fees or raising petrol prices so that the cost of car trips far outnumbers that of other transportation options. In this case, shrewd car owners might quit their vehicles and begin to take mass transit.

If all these measures fail to curb traffic jams, city governments might need to take some drastic actions like limiting car ownership by implementing license lottery.

利弊类 收取拥堵税的好和坏

In some cities, governments have tried to reduce traffic congestion. For instance, they have imposed a congestion tax during rush hour. Do you think this development is positive or negative?

范文:

Currently, a growing number of people have migrated to the cities especially metropolitan ones, and every family tend to purchase their own private cars. However, this tendency gives rise to the phenomenon of traffic congestion in cities and some governments have enacted the congestion to alleviate the situation. From my perspective, it is a feasible method to avoid traffic bottlenecks.

First of all, imposing such tax would lead people to alter their choice to travel. As the traffic modes of residents turn to diversify along with public traffic becoming perfect, a considerable number of people, such as commuters who have reliance on traffic transport, would be unwilling to pay the congestion fees, so they will tend to travelling by public transport in order to save money. As a result, the traffic density during rush hours can be alleviated to a great extent. In addition, by utilizing the congestion tax, governments also can invest in improving the public transport infrastructure by the revenue, which can provide better service and attract more people to choose public transport.

Besides, by introducing congestion tax to control traffic, environment protection could benefit from it as well. To be more specific, the large amount of exhausted gas released by cars is detrimental to the environment, which can cause serious air pollution in cities and lead to several kinds of diseases like bronchitis and asthma. Therefore, imposing congestion tax can not only mitigate the pressure of heavy traffic jams, but also protect the general public's health and well-being.

Admittedly, imposing congestion tax could have an adverse impact on citizens. For example, taxi drivers, who have to drive cars every day to make a living, would suffer from increasing financial burden which they would not have to undertake before. Hence paying extra tax may increase the burden on them economically and reduce their amount of income. However, if the traffic congestion cannot be eased, the cost of fuel consumption might be even more expensive than the congestion tax.

In conclusion, it seems to me that imposing the congestion tax is a reasonable approach to relieve the current dilemma mainly because of the alleviation of jam and the enhancement of the environment.

范文 2:

In many cities, traffic congestion becomes increasingly severe due to excessive use of private cars. In order to combat this situation, many governments decide to initiate a congestion charge during the rush hour. I believe this as a positive development.

There are several advantages of congestion tax. Firstly, imposing tax can effectively reduce the traffic volume in urban areas. Commuters are discouraged from using their own vehicles to work and this method encourage them to use public transport. Lower number of cars on the road also means fewer accidents, which contributes to the road safety. In addition, congestion charges help governments earn more legitimate revenue. Therefore, they can invest that amount to improve its transport infrastructures、 as well as upgrading and expanding public transport provision. For example, the authorities of London have spent a large amount of money on improving capacity and reliability of the subway system in order to ease traffic flow in city centre.

Apart from the practical benefits expressed above, I believe that one of main advantages of congestion charge is to alleviate environmental problems. This regulation limits the use of personal vehicle. Due to fewer car used, the exhaust fumes from cars will be less. Consequently, air and noise pollution will be lessened, which also contributes to the improvement of public health. Furthermore, cities become more attractive for pedestrians and cyclists, thereby improving quality of life.

In conclusion, for all reasons mentioned above, I believe that the congestion tax is a progressive turn as it is beneficial for both citizens and environment as a whole.

观点类 免费公共交通能解决拥堵问题

The best way for the government to solve traffic congestion is to provide free public transportation 24 hours a day and 7 days a week. To what extent do you agree or disagree?

范文:

The boom of private car use in urban streets has ignited the worrying situation of congestion during peak time. To tackle this issue, it is suggested that all-time public transportation service should be practiced free of charge. I personally almost entirely disagree with it.

Admittedly, the increasing accessibility of buses and underground trains would distract daily commuters' demand towards private cars. This echos well with the core of relieving road congestion--controlling the presence of personal vehicles. It can be expected that the zero charging could further mitigate the intense traffic by attracting public to buses.

However, this countermeasure inevitably requires massive human resources and government budget, hindering its implementation in real situations. Its necessity should also be questioned, since the mid-night, free buses seem neither needed nor effective. After all, what eventually lead people from their own cars to buses are the fine-mesh networks of public transportation, taking them directly to the exact destinations without excessive walking.

Moreover, it would be too narrow an approach to relax the busy roads if the authority only confined itself in the given suggestion. Instead, it should firstly be moderated to a rather reasonable level, such as only free service during peak time in holidays or festivals, as the way London did for years. Besides this, rationalizing the traffic light system and road planning are expected to minimize the chance of jam in the busy districts.

In conclusion, the free transportation service for all time can barely solve the jam issue thoroughly if no amendment was attached. Supplementary methods including smarter road schemes should also be adopted to ease the long-lasting traffic congestion

观点类 提升道路安全的方式

Some people think that the only way to improve safety of our roads is to give much stricter punishments on driving offenses. To what extent do you agree or disagree?

范文:

The way of promoting better driving habits has drawn attention to the public nowadays. Personally, I disagree with the idea that imposing stricter punishments on traffic offenders is the only way to make our road safer, because I believe other approaches can be used together to improve road safety.

On the one hand, stricter punishments can certainly be effective to encourage people to drive more safely. Penalties for dangerous drivers can act as a deterrent, meaning that people avoid repeating the same offence. There are various means to heavier penalties, such as imposing huge fines or even prison sentence. The aim of these punishments is to show dangerous drivers that their actions have negative consequences, and thus we would hope that drivers become more disciplined and alert, and that they follow the rules more carefully.

On the other hand, I believe safe driving can be promoted in several different ways. Firstly, it is vitally important to educate people properly before they start to drive, and this could be done in schools or even as part of an extended or more difficult driving test. Secondly, more attention could be paid to safe road design. For example, signs can be used to warn people, speed bumps and road bends can be added to calm traffic, and speed cameras can help to deter people from driving too quickly. Finally, governments or local councils could reduce road accidents by investing in better public transport, which would mean that fewer people would need to travel by car.

In conclusion, while stricter punishments can certainly prevent bad driving, I believe that other road safety measures should also be introduced.

观点类 政府是否该资助公共交通免费

Public transport should be funded by the government so that it can be free for people who use it. to what extent do you agree or disagree?

范文:

There is an opinion that the authority should finance the public transport to make it free for people who use it. This argument has strong merits, though, I have to question the rationality of this practice in terms of the scope of the passengers, and I do not think its implementation should exacerbate the financial burden of the government.

My first question is about the ambiguity of the so-called 'free for people who use it' – does that mean free of charge for everyone or just taxpayers? Considering the contribution to the state fund from the latter, it makes sense that they are entitled to the free public service. However, in cities where a large proportion of their population are visitors from all over the world, I do not think it fair or affordable for the authority to waive charges for everyone on buses or trains. How can a tourism city like Kyoto afford the cost to provide free transport for tourists whose number are several times the local residents?

Another problem is that a free public service should not necessarily lead to an extra burden for the state budget, whereas there may be alternatives to governmental funding to cover the financial gap left by free service. One practical option is advertising, which is proven to be one of the most effective profit models for public transport by many counties. A successful case in this point is the subway systems in Shanghai, where advertising boards, poster and LEDs are ubiquitous at almost every corner of the trains and stations. It is those advertisements that bring in millions of dollars every year, which in turn support its policy of low ticket price in the city.

In conclusion, I do not think it rational to make public transport free for everyone who use it, and it is simple-minded to rely only on government to fund the service.

城市规划类

利弊类 在特定区域安排商店、办公室和住宅

In some cities, planners tend to arrange shops, offices and homes in specific areas and separate them from each other. Do you think the advantages outweigh disadvantages?

范文:

Given the shortage of affordable housing across many parts of the world currently, the issue of town planning is a major issue for many people. Additionally, the nature of the modern world economy has led to a situation, some would say, where traditional communities are being sacrificed in the interests of sustained economic growth. There can be no better example of this than modern town planning.

Traditionally, a local community would revolve around a large area, within which various institutions and social stakeholders would be concentrated: shops, restaurants, community groups, religious organisations and community leaders to name but a few. Within these communities, a strong, close-knit sense of collective responsibility would ensure that the local amenities, services and environment were looked after with a sense of shared values. This was commonly referred to as community spirit: an essential feature of community management.

In the modern world, however, the increasing sight of high rise buildings, shopping malls located away from residential areas and community leaders either detached from local residents, if not replaced altogether by global economic forces, have led to a situation where the traditional sense of local community has all but broken down. Shopping malls located on the outskirts of residential areas cannot generate the same sense of community spirit as shops located within residential areas, where shopkeepers and customers all had a stake in looking after their local area. Factors such as this have created a situation whereby traditional community spirit, as a way of looking after the local community, has vanished and fewer people care about the area in which they live.

In that sense, it is clear that modern town planning initiatives have failed to take into account the shared values that once characterised local communities, sacrificing social cohesion and common purpose as a result.

范文 2:

Different conceptions are introduced by planners to make arrangements for the urban area; some may consider separating functional areas like shops, offices, and residential complexes from each

other. However, no one knows for sure how this works in the long run, and what would be the future of this development.

Whether this type of distribution of areas within a city is advantageous or not depends on a set of factors lying behind, among which the technology, transport, and logistic system play a part. What we can imagine from the outset of a city divided into different functional areas is its inconvenience, since the simplification in any individual part means people may have to travel from place to place to fulfill their diverse requirements. One would be forced to drive long distances away from their offices for just one coffee, or to purchase a batch of goods stuffed in their trunks whenever they had a chance to go to a department store away from their home. However, the scenario mentioned would be theoretically altered by solutions like online ordering, through which the purchasing may be realized over the internet, and there would be couriers out there providing delivery services on food and other commodities.

The reasoning listed above may have yet to address some other questions, like how to make the online system friendly enough for groups like the elderly. The truth, however, is that there is an alternative possibility where we consider residents' living convenience from another perspective. To integrate facilities with the same function means that users would be clear about their destinations, knowing where they would go if they need to, say, buy things that may otherwise be hard to find in a city dotted with stores and groceries. The traffic system would also be optimized to a large extent; commuters would travel more regularly within a day, and what the city authority should do is to deal with congestion around prescribed regions specific hours. Nonetheless, it would still not be that easy for residents to precisely find out what they want when the business district is extended, and planners still need time to build up the relatively perfect transport system.

I believe that the real situation would lie somewhere in the middle. The plan seems to bring convenience to people, and there is no need to worry about the complications that are yet to emerge. However, we may still have a reflection about how things are going to be and whether the future development of technology and the transport system may or may not solve the problems that come along.

观点类 新城镇规划，公园健身房 VS 购物中心

When new towns are planned, it is more important to develop public parks or sports facilities than shopping centers for people to spend their free time in. To what extent do you agree or disagree?

范文:

It has long been a controversy whether we need more parks and sports centers or shopping malls in our cities. To me, I tend to vote for the former two facilities when considering their comprehensive benefits to the public health.

Superficially, it is department stores that might be attractive to some people, especially the younger generation. To them, more shopping centers means increasing convenience, which not just provides a wider variety of commodities but also saves them much time in searching for different products. This is particularly important to those busy working adults in a fast-paced modern life. Apart from urban dwellers, shopping centers are usually reckoned as a tourism attraction for travelers, especially for those from developing countries. A convincing example is those super shopping malls in Paris and New York, which absorb millions of dollars to the local tourism every year.

However, I would say that it is the parks and sports facilities that deserve more priority in development of new towns. While shopping centers are more like a paradise for youngsters, it is the public parks that is suitable for people of all ages and various interests to spend leisure time, from jogging to fishing, camping to painting. It provides a precious opportunity for each individual living in concrete jungles to relieve themselves in nature, which is beneficial to their mental health.

Also, more sports facilities will make it easy for people to do more exercise, which in turn will increase the physical fitness of the public, thus simulating an active lifestyle for those who are collapsing in front of computers.

To sum up, attractive though shopping centers are, I would reiterate that it is public parks and athletic facilities that is conducive to the health of the masses.

范文 2:

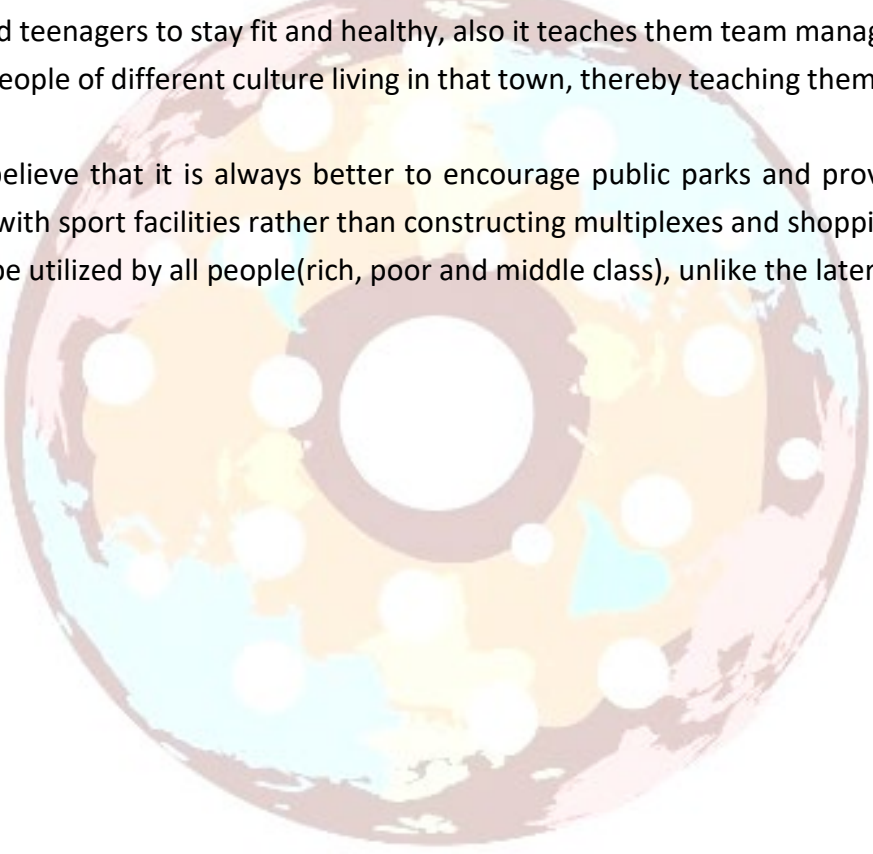

There have been debates about whether it is better for a new town to sanction public parks and sports facilities or shopping complexes. In my perspective, involving a larger number of public parks and sports facilities is more reasonable.

To begin with, shopping centers are not preferred by all the categories of people for spending their free time. There may be people who cannot afford to spend money for shopping every time they visit

these centers when they are free. Moreover the rates on items on these shopping complexes or multiplexes are very high when compared to small shops and street market. So, not all people encourage them, especially middle class people.

On the other hand, public parks and sports facilities can be utilized by all categories of people, regardless of their economic status. Firstly, parks provide opportunities for people living in same town to get to know each other, thereby extending their circle of friends. This is especially beneficial for retired people, who can spend their free time mostly in parks, such as playing some indoor games like caroms, chess, etc with other people in the locality. In addition, playing sports in sports centers help children and teenagers to stay fit and healthy, also it teaches them team management and how to mingle with people of different culture living in that town, thereby teaching them mutual respect.

To conclude, I believe that it is always better to encourage public parks and providing the newly proposed town with sport facilities rather than constructing multiplexes and shopping complexes as the former can be utilized by all people(rich, poor and middle class), unlike the later.

公众号：雅思情报圈

观点类 城镇有大型室外公共场所的必要性

It is important for all towns and cities to have large public outdoor places like squares and parks. To what extent do you agree or disagree?

范文:

I think that squares and parks are the foundation of modern cities and have become an indispensable part of cities. So squares and parks should be established in every city and town.

First, urbanization is the progress in which population has converged. In some villages, residents usually live around small public buildings, like churches. With increasing population, these confined spaces could not meet the demands of the locals, and therefore, large squares and parks have been established to host lectures, ceremonies and even carnivals. Therefore, it is of high necessity for a city to possess prestigious squares or parks.

Besides, in urban areas, when assembly occurs for celebrations or festivals, a large number of residents will get together to listen to lectures or appreciate performance. If there were too many participants swarming into narrow and crowded public space, trampling events would happen inevitably. On the contrary, squares which provide broader areas and hold huge population can easily avoid these tragedies.

Thirdly, squares and parks have increasingly become a city landmark. For example, Central Park in New York and Red Square in Moscow have represented character and history of the city, and therefore, they have become one of the most significant components to the city, let alone more tourists and travelers have been attracted to cities for grand monuments on squares and admire tranquility in bustling city.

In a nutshell, city residents are used to living with squares and parks, which has become an inalienable part to modern life.

公众号：雅思情报圈

观点类 工厂和公司搬到郊区能解决交通住房问题

Traffic and housing problems in major cities could be solved by moving large companies and factories and their employees to the countryside. To what extent do you agree with this opinion?

范文:

A series of severe problems derived from urbanization has triggered a contentious debate, such as traffic congestion and housing problems. It is claimed that removal of large companies and staff can solve the problem. However, I do not concur with this view because this is not a sustainable method to mitigate or even tackle urban problems. Instead, narrowing the gap between city and countryside and reduction in urban population are the better one to curing city sickness.

Granted, this policy of moving factories and employees to countryside can alleviate urban problems in a short period. Increasing land resources can be used for apartment buildings and public road system, which in a short time relieves of heavy traffic jams and lowers the price of estate.

However, with time passing by, the problems aforementioned would be severe again. This is because the more numbers of employees moving out of the city, the more new immigrants swarming into the city. Cosmopolitan cities provide high-qualified living facilities and more job opportunities in service industry, which attracts more young generation from rural areas. Therefore, the burgeoning population in cities gives rise to a variety of problems and traffic and housing problems cannot be solved thoroughly.

Even worse, this policy cannot prevent workers from living in cities. For those with family and relatives in urban center, they seem not to stay in countryside for too long and are more likely to return to cities rather than stay in countryside.

In contrast, the wide disparity between the two areas is the chief reason for the problem. So, it is suggested that more investments should be offered in countryside living facilities and living environment in order to balance the living quality.

As conclusion, this removal policy cannot solve the city problems completely and instead, bridging the gap between the two areas through improving rural living condition is the effective method.

双边类 减少上班路上时间最好办法是拆公园造公寓

Some people believe that the best way to reduce the time to travel to work is replace gardens and parks with apartment buildings, which commuters can live. Others disagree. Discuss both views and give your opinion.

范文:

A problem that frustrates working adults is the time wasted on their way to work, with conflicting views on how to tackle this issue. Some people believe that the best solution is to replace the gardens and parks in downtown with apartments, so that working people can live closer to the business center. To me, I do not regard it as a good idea when considering its detrimental effects on environment.

It is easy to understand why this suggestion is crowned as a panacea. Those who harbor this proposal attribute the long travelling hours to the city planning of modern metropolises, where many residential areas are located in suburb, resulting in the fact that the residents have to spend much time on commuting between home and workplaces. In this respect, if the government demolished public green space in downtown to accommodate more working population, it would shorten their distance to offices to a large extent.

Plausible though the proposal seems, I would stand by those opponents, who attach more importance to the potential air pollution that will ensue. What is ignored by those opt to remove green land is that it is the trees in those gardens and parks that generate oxygen, absorb greenhouse gas emissions. Were it not for these oases, the air quality of our cities would deteriorate, and the resulting public health problems would far outweigh the superficial convenience in travelling. In response to this, other alternatives need to be taken into consideration. For example, the Internet will have its role to play. With e-communication tools like video conferencing, it is possible for people to deal with business at home rather than punching in every morning in the office.

In conclusion, I would reiterate that removing gardens and parks is not the silver bullet to reduce the commuting time of working people.

双边类 垂直城市与水平城市

Some people think “vertical city” is the best, where people live and work in tall buildings. Others think “horizontal city” is better, where there are few tall buildings. Discuss both views and give your own opinion.

范文:

I would discuss the both thoughts that myopically separate the urban constructing modes totally from one another; cities work more effectively when combining the vertical buildings and the horizontal ones together.

Many may consider vertical city as the prior choice for planners to set up their city mode, but flaws may be witnessed when without the coordination of horizontal ones. The reason why they lean their views on this may be the thinking of the current situation or the future development of most regular cities. Once wanting to become, or should I say harboring the potential of becoming a metropolis, those urban places should have the capacities facing the problems emerged alongside the booming: a flowing and expanding population, an increasing prosperous industrial scale, the proliferating use of transport and a perfect balance between the modernization and the identity belonging to the city per se. Therefore, urges may be manifest for owning a multi-functional construction property to fulfill the need for convenience and for integrating more people in a limited place; high-rise buildings or the skyscrapers has to be the option under this circumstance. Whereas there are also demands for maintaining something unique for those cities; it is always necessary to preserve the cultural identities, most of which are reflected in the constructions inherited from history, and are largely “horizontal buildings”. That means, a city combined with both skyscrapers and low-layered ones may not only imply to build the both, but to mainly focus on building vertical ones together with the conservation of ancient, classic horizontal structures—that is, to never forget to maintain the own characteristic of the metropolis, for its life power in the long-term paths, because the identity is the only thing distinguishing a city from others, and avoiding it from being sunk in the overwhelming urbanization.

Recklessness, however, would also be manifest when others superficially claim that living in an urban area with few high-rise buildings would be with more outweighing benefits. They certainly narrow their mind just on the individual living experience but not from a rational, macro perspective. Clearly, living in a region with few tall buildings is more comfortable and secured than the life in only tall structures: after all, people gain more privacy when there are not too many people sharing a wall; they are less interrupted by neighborhood when dwellers are not too integrated inside a limited living space; a smaller residential group is also more easily arranged and coordinated; even the visual field outside the window would be more balanced than the high-rise buildings, which would themselves block views from different areas, and in which visions in different layers totally vary. Whereas all the

aforementioned edges of living in a horizontal city would be firstly realized by the capacity of a city in accommodating its dwellers without too many barriers; housing problems would otherwise overwhelm the living conditions inside the city, and it then becomes less efficient since one can hardly find enough horizontal spaces to fulfill the need for housing. A combination with vertical construction would be obliged for city planners to balance the living comfortability by the horizontal buildings and the capability and functions provided by the high-rising ones—multiple instances and data points have also proved the mix is most frequently adapted by metropolis worldwide.

In conclusion, I would very much agree that any isolated constructing mode is not suitable enough for most current urbanization; effectiveness is manifest for combining the both constructing modes.

公众号：雅思情报圈

观点类 建造大型户外场所

It is important for all towns and cities to have large public outdoor places like squares and parks. To what extent do you agree or disagree?

范文:

Some people argue that certain residential territories such as cities and towns would benefit from possessing enormous outdoor structures like squares and parks. Personally, I strongly believe these places are to be profitable for both individuals and societies.

Due to hectic and busy lifestyle, numerous people nowadays tend to suffer from a lack of time to spend with their families. Considering this, parks may prove advantageous as they enable parents and children to relish some quality time together, hence yielding highly boosted familial bonds. Furthermore, deemed as the lungs of the cities, parks helps people to lead a much healthier path of life. Teeming with trees, these green spaces would absorb carbon dioxide abounding in the atmosphere and return oxygen instead, in the long run, assisting people with their respiratory problems.

At a societal level, these public places might be profitable as they appeal to a wide array of tourists who carve for architecturally rich structures such as squares. The Central park in New York city, for instances, attract a large proportion of tourists to visit and is chosen to be shooting location, which can boost the authorities' revenue. Additionally, squares might even resurrect some old figures who once played a substantial role in nations' history and culture. These forgotten ancestors of us might be revived if squares are equipped with some structures, such as statues and sculptures, which may remind people of their forebears.

Nevertheless, some people may suggest that constructing parks and squares might wreak havoc on already congested cities and towns, as these structures are likely to occupy the spaces deemed necessary for residential and business complexes. However, I believe peoples' heath and history should be prioritized over any other thing.

In conclusion, I think vast open-air places such as parks and squares are highly likely to be beneficial both socially and individually

利弊类 根据喜好建造房屋

In some cities, there are few controls over the design and construction of new homes and office buildings, so people can build in whatever style they like. Do you think advantages outweigh disadvantages?

范文 1:

It is common to see that more and more individuals and companies demand to have a complete control over the design of their residential properties without any interference from the authority. While this development has a certain number of benefits, there are several demerits which need to be considered.

On the one hand, entitling people to freedom in house design is advantageous to a certain extent. As home is a very personal space, being able to design it to our liking can be immensely enjoyable. If home owners are deprived of this freedom, they would feel uncomfortable and frustrated with their own property, which may adversely affect other aspects of their life. On the city level, having variation in house design could help the neighborhood and even the city as a whole look more vibrant. Paris perfectly exemplifies this principle. This city is hailed as one of the most unique in the world as far as architectural style is concerned, which can be attributed to the fact that the houses here do not conform to a fixed aesthetic.

On the other hand, I am convinced that the aforementioned benefits are at the expense of greater drawbacks. First, there is the question of safety. The lack of control on how houses should be constructed could put the lives of the inhabitants in jeopardy. Second, aesthetically speaking, if home owners are allowed to design their house however they want, they may err on the side of being too adventurous and the building would look out of place with other structures in the same area. Most of us are not well-versed in architecture and home design, and houses that are in bad taste could seriously spoil the beauty of the city.

In conclusion, while letting people freely design their houses could be beneficial to some extent, I believe it would be better if there is a standard that everyone can adhere to.

范文 2:

The short-term benefits brought by the free development of construction industry may be overwhelmed easily by the following disorders of the city.

Directly, free of control over the design or construction in architecture may give rise to both the prosperity in building industry as well as the related areas on the one hand, and the cultural diversity

of a city on the other. By conferring a domain with the autonomy without giving any restrictions, the city can immediately gain the booming within a certain industrial chain. Out of control of the building industry doesn't mean a definite economic improvement, but it inevitably powers the engine of generating more potentials inside the market: building conceptions are more likely to be realized in this circumstance; innovations may prevail the practitioners; multiple ways of trading and connection are established—people are extremely good at this, especially when no barriers can be seen in this area. All these contribute to commercial possibilities, since the modern merchandisers can always find a way to acquire huge profits. A more plausible advantage is that this type of free development on building industry signifies integrations, both vertically and horizontally. It is easy to imagine how the freedom can promote cultural identities, when stylistic constructions are erected in a city out of any constraint of the ordinary rules, diversified in designs, manifesting the characteristics a city may be endued with, evoking the virtuous circle that a throng of inspiring, prodigious architects striding into the city for the chance of playing their talents; this is also helpful in tourism, with more visitors would pay for seeing the colorful, multiple functional building areas.

The problem should be more deeply considered from a sustainable prospect, to ensure that all the aforementioned possibilities are smoothly implemented, but sometimes, people may be over-optimistic in this respect, so that they are deviated from the truth beneath the superficial, shortly emerging advantages. A long-term lack of restriction and censorship in a particular area would invariably lead to an unordered scenario, especially in such an economic titan, namely constructing industry, where no parameter is defined to measure the feasibility of the buildings; no law is set up for manipulating any disorder during the architecting process. Would the economy be really better? All I would prophesy is the unbalanced trading modes, full of scandals and monopolies in light of no supervision system showing effectiveness. Furtherly, the cultural embodiment may be also poor. People are hard-wired behaving individual, and no rules to the buildings make people definitely construct their houses without considering others by occupying too much public spaces, or ignoring the overall planning of the community in terms of the facility and transportation. This type of layout of a city, granted doesn't have the ability of attracting a long-term tourist resource, due to its huge inconvenience on urban functions, and a relatively eccentric display on the macro view.

In conclusion, the immediate benefits of the free of control of architectures in a city are surely not long-lasting, and would be outweighed easily by the coming along calamities. One should truly look inside the phenomenon to rationally consider the problem.

观点类 建筑物满足需求还是变成艺术品？

It is more important for a building to serve a purpose than to look beautiful. Architects should not worry about producing a building as a piece of art work. Do you agree or disagree?

范文：

Recent decades have witnessed considerable changes in the appearance of buildings due to several reasons, and there are some people who believe that architectures should lay emphasis on the practical value of the constructions rather than their aesthetic value. Personally, I disagree with this idea.

First of all, buildings with unique shape can be used as landmarks to boost the local tourism. This is largely because that the most attractive tourist attractions are generally with good natural scenery, strong historical value or obvious architectural features. Compared with the first two features which are hardly to alter by current citizens, the design of the moderns buildings can be determined at the beginning of plan. Although the cost of building with unique shape is generally higher than those solely serving simple functions, considering the large number of new tourists attracted by these establishments, this is actually a very profitable behavior. Apart from the aesthetic value of building, the appearance of buildings can surely influence the local surroundings as this constructs part of the atmosphere. Stunning cosmetic architectural features can illuminate a boring neighborhood, while the single and monotonous environment will weaken dynamic of people's thought, which eventually gives rise to the impairment of people's innovation ability.

Admittedly, any building is constructed to serve a purpose, which might be accommodating, storing and so forth. Therefore utility of constructions, especially the ones of residence, is widely recognized by most architects and the general public as well. Focusing on function is also a cost saving practice as various ornaments which serve no obvious function would be simplified at the greatest extent or even eliminated.

Overall, it seems to me that it would be ideal that a building satisfies both functional and aesthetic aspects, but considering the effectiveness of the buildings with attracting shapes, I strongly recommend that the designers should not completely sacrifice the appearance of constructions and only focus on the purpose.

观点类 设计新建筑是实用性重要还是外观更重要

When designing a building, the most important thing to take into account is the intended use of the building rather than its outward appearance. To what extent do you agree or disagree.

范文:

There is always a trade-off between technology and art in architectural design. Technology helps to achieve the function; art satisfies the desire for beauty. While, which one should be given the top priority? functionality or beauty? I think the construction type or, we could say, the specific purpose the building serves needs to be taken into account when weighing up the both.

The design of those ‘functional’ buildings, reasonable or not, is determined to some extent by whether it fulfills the fundamental requirement. Hospitals are designed to be functional first, a beautiful look is not strictly necessary. To speed up the healing process, an optimum climate is needed, which necessitates a protective ‘filter’, seal the inside from the outside. The partitions and the layout of wards must make it possible to realize the sterile operation or to reduce the incidence of infection.

Also, for a storehouse, say, a store room for baby formula, the structure itself acts as a ‘shelter’ to protect against the sun, wind and rainwater, achieving an safe interior climate, measured in terms of temperature, humidity and illumination, to minimize the odds of tainted milk. The designers of jail should embark from its most basic function, to imprison people and to make it impossible for detainees to escape. The materials used must be selected purely to enhance this purpose. A workshop should be equipped with good drainage facilities to ensure sanitary processing. In chemical dye factory, a sound ventilation is a must in the casting shop in case the workers’ intake metal powder. An effective rescue requires the fire station to have good accessibility, to be arranged flexible in evacuation route.

While, as for those buildings function as a a bearer of ‘aesthetic’ meanings, particularly in public buildings like churches, museums, art galleries and town halls, although utility value also play some part, the top priority in design is on beauty. Symmetry and decoration are all used to evoke a sense of beauty. The pointed arches, high vaulting and flying buttresses of Gothic churches make the walls seem lighter and higher, the design supports the function of meditating on God and uplifting the human soul. People are more or less swayed by looks. For a batch of landmark architectures, an important component is eye-catching colors to display the grace of cityscape and the ingenuity of designers.

Last, for the residential buildings, a cozy functional space that fits seamlessly into its surroundings should be realized without losing its beauty.

混合类 旧房子只适合当时的居住需求

The world has many towns and cities constructed in previous centuries that are suitable and livable for people in those times. What problems will this cause today and what can be done to solve these problems?

范文:

One of the conundrums that exhausts many municipal authorities is how to deal with clusters of old dwellings that were built centuries ago. Following are some problems of these public nuisance we need to familiarize ourselves with, coupled with possible solutions accordingly.

The most frequently mentioned problem with historical buildings is their livability. The utility facilities in century-old housing are obsolete by today's standards, whether these be electric and plumbing systems, underfloor drainage design, or anti-fire building materials, not to mention the apprehension about their building materials in terms of increasing needs for environmental protection and energy saving. Some might argue that these problems could be addressed by refurbishment; however, that begets another problem – the enormous cost of continuous and large-scale maintenance inevitably exacerbates austerity of many governments.

However, when properly evaluated, the dilemma of renovating or demolishing historical constructions will be tackled. For those dilapidated dwellings without cultural values, the authority should take steps to replace them with new housing which are designed to meet modern safety code. On the other hand, for those with cultural or architectural meaning, the administration can relocate their residents and rehabilitate these buildings for tourism purposes. By doing so, not only will the apprehension about livability be mitigated, the cost of maintenance can be offset by revenue from ticket sales.

It is my conclusion therefore, despite the livable and economic concerns of historical constructions, a combination of rehabilitation and demolition is needed according to the specific value of individual buildings.

混合型 哪些老房子更值得保护及其利弊

Some people think certain old buildings are worth preserving more than the other ones. Which types of old buildings should be preserved? Do you think the advantages of preserving old buildings outweigh the disadvantages?

范文:

The preservation of old buildings is one of the major concerns in the modern era, with the controversy about which types of constructions deserve to be protected. To me, it is those with historical and cultural background that need preserving, given their return in economic and study perspectives.

When it comes to the pros and cons of protecting old buildings, I would say that it depends on what types of structures we are talking about. For those dilapidated ones without historical value, I do not see any good reasons to maintain them. Rather, it is a waste of both taxpayers' money and the scarce land resource in big cities. What is more worrying is the potential risks to the safety of people who live inside, considering the fact that most electric and heating systems in those dwellings have exceeded their design life.

Nevertheless, those with historical and artistic values are worth preserving in terms of their overwhelming advantages. Firstly, they are of paramount importance in the academic study of architecture, as many of these structures represent the certain architectural design, genre and construction technics of a period. Another key benefit we cannot afford to ignore is the economic rewards. These buildings are usually reckoned as landmarks of a place, which attract millions of visitors every year. By maintaining them, not only does the government make enormous profits in tourism income, but also will create more job opportunities with the booming tourism, say, tour guides, hotels, restaurants, and taxi drivers.

In conclusion, it seems to me that it is those historical buildings that deserve our conservation, as their benefits in economy and study far outweigh the cost of protection.

观点类 维修老房所消耗资金应用于造新房和修路

The restoration of old buildings in major cities in the world costs numerous governments' expenditure. This money should be used in new housing and road development. To what extent do you agree or disagree?

范文:

While I agree that the conservation of worn buildings is a costly task that exhausts many governments, I do not think it should be the reason to curtail the budget for renovation and use it to build new houses and roads.

Indeed, it makes sense that some might regard the preservation of old buildings as a waste of money, particularly when compared with the advantages brought by their modern counterparts and traffic infrastructures. Many shabby dwellings are ruined not only in appearance, but also in the internal structure, meaning that the renovation might cost approximately same as building a new one, whereas the return is much less than the latter. For instance, modern structures using greener building materials might have added benefits in energy saving; or a new road might alleviate the traffic congestions that frustrates millions of commuters, thus increasing the overall efficiency of working adults.

Nevertheless, plausible though the opinion seems, I do not think it rational to label a policy as a waste simply because of the cost of implementation. There are many projects that account for a large proportion of state fund, but we do not expect them to be abandoned. To take the medical insurance for senior citizens for example, I doubt any authority would suspend the subsidy and spend the money on other profitable projects. Instead, whether tatty constructions should be preserved hinges on their values both in culture and economy: many historical buildings are reckoned as a manifestation of the culture and history of a city, and therefore increase tourism incomes. A case in this point is the Summer Place of China, one of the oldest buildings in the country, which earns millions of dollars as a famous tourism attraction.

In conclusion, though maintaining old building does require much money, I do not think the government should ignore their importance and spend all the money on modern infrastructures.

观点类 拆除旧建筑建设新建筑

Too much money spent on looking after and repairing old buildings. Some people think we should knock old buildings down and build new modern ones. To what extent do you or disagree?

范文:

Apart from the various types of bread-and-butter projects that entail government's urgent attention as well as financial support, the government also spends much on the restoration of old buildings. However, there exist some people who argue that financial resources should not be devoted to this but to construct new ones as substitutions. Personally, I partially agree with this idea.

First of all, constructing modern buildings meets the urgent need of the current situation. This is largely due to the fact that with the soaring population in urban areas, especially in metropolises, the housing problems become aggravating. Newly-established buildings are always high-rise ones which could accommodate more people without occupying much ground space, which could minimize the pressure brought about by the population explosion.

Apart from the housing pressure, another reason is that the sustainability and durability of new buildings are usually more desirable than the old ones. Thanks to the advances in high technology, new buildings often enjoy more reasonable structure and better building materials, which on the one hand provide people with comfortable living surroundings, and meanwhile enables them to cope with natural disasters, such as earthquakes.

Admittedly, some ancient buildings, especially those with aesthetic value, do deserve to be well repaired. Since these constructions comprise both historical value and attracting appearance, after the restoration they can certainly boost the tourist industry, which is quite profitable and substantially increase our national revenue. However, as this kind of buildings is rather limited and most old ones do not possess both values mentioned above, demolishing them is more essential.

In conclusion, it seems to me that establishing new buildings instead of fixing old ones is more crucial mainly because of the current situation as well as sustainability that new ones have.

范文 2:

Besides various types of bread-and-butter issues that entail government's urgent attention as well as financial support, the government also spent much on the restoration of ancient buildings. There are some people who argue that these constructions are actually useless, which should be demolished and substituted by the modern ones. Personally, I partially disagree with this idea.

The first reason why the maintenance of old constructions is crucial is largely attributed to their unique historical value. Some ancient buildings, such as the Forbidden City in China and Notre Dame de Paris in France, can be regarded as symbols of their countries and the cultural heritage bestowed by their ancestors. Investing in regular maintenance of these ancient buildings can always inform offspring of their splendid history and enhance their citizens' sense of national belonging. It cannot be denied that in the era of peace, the exchanges among countries seem to be normal. However, it becomes extremely crucial for their citizens to maintain a firm sense of patriotism and safeguard the interests of their motherland when facing crisis and conflicts, by which I mean the existence of the national symbol has become extremely important.

Apart from the historical value of ancient buildings, another reason lies in their profit value. For example, Spain, as one of the oldest countries in Europe, has well preserved a large area of ancient buildings, which provides excellent support for the sustainable development of Spanish tourism. Besides, the Spanish government also found another way to explore the economic sustainable development of the protection of ancient buildings, namely, the model of Royal post station, through which the ancient buildings with historical and cultural value but cannot be fully protected are transformed into hotels, which ensures the economic development while protecting ancient buildings.

Admittedly, under the mounting pressure of exploding population, replacing some old buildings with new building, most of them are high-rise ones, is a must, by which I mean the modern buildings can accommodate more residents without occupying much space, which could largely alleviate the pressure caused by the overpopulation. However, there are several optional solutions instead of knowing the old ones directly when dealing with this social problem. For example, new buildings can be newly set up on the vacancy space in the countryside, which may be even more affordable compared with those constructed in the downtown.

In conclusion, I personally believe that subsidizing the maintenance of old building is indispensable mainly because of their irreplaceable historical value and potential financial feedback of these buildings.

观点类 旧建筑是否应被拆除建新建筑

People think that old buildings should be knocked down and give way to the modern buildings. To what extent do you agree or disagree?

范文:

Land resources in cities have become increasingly scarce in recent years. Some people suggest knocking down old buildings in order to make room for modern ones. In my opinion, however, old architectures have their values and should not be demolished.

Firstly, if ancient architectures are torn down, cities and countries would surely be less appealing. This is because the beauty of landscapes in urban area is often reflected in the contrast of diverse architectonic styles. Traditional constructions, which are established in different phases in the past, tend to represent unique features with specific color, shape, structure and function. Imagine a city where all these old buildings are replaced by blocks of modern high rises; it would be as boring as a song with monotonous tones or a banquet with many identical dishes.

Second and even more importantly, though, is that dwellers of a city or town are often sentimentally attached to the old architectures. Viewing the former house or previous school building, though some of which are obsolete now, a person may suddenly recall his happy childhood events or the arduous work at the start of a prominent career. There is no exaggeration to say that old constructions have already integrated into the memories, as well as self-identities, of local residents. Although some would argue the usefulness of modern skyscrapers, they may consider setting these new buildings up at the outskirts of cities, not necessarily at the expense of old ones.

In conclusion, I once again restate my position that traditional buildings should not be dismantled since they create attractive environment for and record the past of locals. In order to develop cities, modern buildings should be situated in suburbs if there is no spare land downtown.
